DESCRIPTION: Sentinel AN/MPQ-64 consists of a radar-based sensor with its prime mover/power, identification friend or foe (IFF), and FAAD Command, Control, and Intelligence (C2I) interfaces. The sensor is an advanced three dimensional battlefield X-Band air defense phased-array radar with an instrumented range of 40 km. The Sentinel is capable of operating day or night, in adverse weather conditions, in the battlefield environments of dust, smoke, aerosols, and enemy countermeasures. It provides 360 degree azimuth coverage for acquisition tracking. The Sentinel contributes to the digital battlefield by automatically detecting, classifying, identifying, and reporting targets (cruise missiles, and unmanned aerial vehicle, rotary wing and fixed wing aircraft). Targets can be hovering to fast moving, as well as, from nap of the earth to the maximum engagement altitude of Short Range Air Defense (SHORAD) weapons. Very accurate and quick reacting, Sentinel acquires targets sufficiently forward of the Forward Line of Troops to improve SHORAD weapons reaction time and allow engagement at optimum ranges. The Sentinel integrated IFF reduces the potential for fratricide of Army Aviation and Air Force aircraft. Highly mobile and reliable, the Sentinel Anti-Radiation Missile and Electronic Countermeasures resistant performance supports Army Corps and Divisional Air Defense operations across the full spectrum of conflict.

JUSTIFICATION: FY 99 funds provide production hardware for four National Guard units (3-200th ADA, 3-265th ADA, 4-200th ADA, and 2-265th ADA).

DESCRIPTION:

Army Key Management System (AKMS) is the Army's system to integrate the functions of Communications Security (COMSEC) key management control and distribution, Electronic Counter-Countermeasures (ECCM) generation and distribution and Signal Operation Instructions (SOI) management into a single automated system. AKMS will electronically generate and distribute Army key and key-related material, thereby limiting adversarial access to, and reducing the vulnerability of, Army C4I systems. AKMS capabilities will also increase operational flexibility and reduce force response time. It provides communications and network planning with key management on a single platform. AKMS is part of the management/support infrastructure for the Warfighter Information Network - Terrestrial (WIN-T) program, which provides critical functions for the Army's digital systems and Force XXI digitization effort.

JUSTIFICATION:

FY 99 funds will procure Data Transfer Devices (DTD's), continue the upgrade to the CHS workstations, and provide for the associated government and contractor engineering support and fielding. The DTD which hosts two versions of software, the Automated Net Control Device (ANCD) and the Key Distribution Device (KDD), will be fielded with the SINCGARS radio and to other non-SINCGARS users. The FY 99 funds will help meet the Basis Of Issue Plan (BOIP) requirements to field DTDs to Reserve Component Units.

FY 99	GTE, Taunton MA	FP/OPT	СЕСОМ	Feb-99	Feb-00	276	13	YES		

REMARKS:

Funding for FY98 contract option of CHS Transit Case includes Mass Storage Expansion Units (MSEU) Operational Transit Cases and mounting assembly not available/negotiated during FY97 CHS Upgrade (Workstation) buy. These will be delivered in Feb 99 with the CHS Upgrade Workstations ordered in Feb 98.

^{*} Commercial off-the-shelf equipment procured on the CHS-2 contract

Due to a significant increase in BOIP requirements the LCMS Phase IV update has been deferred to FY00 in order to buy DTDs in FY99.

DESCRIPTION: Funds the Army's Information System Security (INFOSEC) Program (ISSP). Provides communication security, cryptosecurity, transmission security, emission security, and computer security equipment and products as a means for protecting telecommunications and information systems which process classified, mission sensitive, national security, and related sensitive information. Prevents exploitation through intercept, unauthorized electronic access, or related technical intelligence threats. Ensures authenticity, integrity, protection and availability of information transmitted by information systems.

JUSTIFICATION: FY 99 funds buy:

Tactical-Secure Terminal Equipment (T-STE) to provide INFOSEC transparent to the soldier and solutions for TOP SECRET/Special Intelligence subscribers to echelons above and below corps communication systems. T-STE is needed now to resolve problems of secure interface of strategic, tactical, and commercial communication systems as identified by the Joint Staff (J6) in the Multiservice Communications Electronics Board (MCEB) in August 1993/March 1996. AIRTERM KY-100 to protect tactical communications for attack helicpoters and fixed wing aircraft. Firewalls, Taclane KG-175 Guards, and High Assurance Guard to secure Army's portion of the Defense Information Infrastructure. Army Key Management System, Tier 1, Secure Trusted Local Area Network for managing Army's automated Electronic Key, Communication Security (COMSEC) and INFOSEC material. New equipment training, first destination transportation, and consummable parts for total package fieldings.

DESCRIPTION: The K38400, AN/PLQ-8 Target Location Observation System (TLOS) is an active or passive, day or night sight. It is target acquisition system designed to detect threat Optical and Electro-Optical Systems. The TLOS can be used as a covert illuminator and fire direction pointer. The AN/PLQ-8 TLOS is a part of the roll line KA3500 Night Vision Devices until FY99.

JUSTIFICATION: The "Own the Night" initiative, one of the Chief of Staff of the Army's top five priorities, includes the AN/PLQ-8 TLOS. The TLOS is the only handheld device capable of precisely locating threat optical and electro-optical signatures on the battlefield, and its use will greatly enhance U. S. Forces combat effectiveness. The FY99 funds will procure the restructured technology configuration for fielding to the Special Operations and Light Forces (75th Rangers, 82nd Airborne, 101st Air Assault, 10th Mountain, 2nd and 25th Infantry, and Scout Battalions).

NOTE: AN/PLQ-8 TLOS was restructured in March 1996 in accrdance with (IAW) SECDEF guidance. Results of restructure are reflected above.

REMARKS:

AN/PLQ-8 TLOS Program was restructured in March 1996 IAW SECDEF Guidance. Results of restructure are reflected above. ETLOS represents the restructured program and is referred to as the Enhanced TLOS.

The FY 1997 procurement funds were internally reprogrammed with the concurrence of the user and HQDA to K36400 and K30800.

DESCRIPTION: Night Vision Devices (KA3500) is a summary budget line. There are five subsidiary lines which are: K36400 Night Vision, AN/PVS-7/14 AID; B53800 AN/PVS-6 Mini Eyesafe Laser Infrared Observation System (MELIOS); K41500 AN/PVS-10 Sniper Night Sight (SNS); K35000 AN/PAQ-4 Infrared Aiming Light (IAL); K30400, HTI Training Devices. (1): The AN/PVS-7 is a lightweight, Night Vision Goggle consisting of a monocular Objective Lens Assembly, one state-of-the-art Third Generation Image Intensifier tube, and two Eyepiece Lens Assemblies integrated into a housing which is affixed to the user's head or helmet. The AN/PVS-14 Monocular Night Vision Device is a variant of the AN/PVS-7 in that it has only a single lens assembly. The AN/PVS-7/14 is used by individual soldiers at night to perform Combat, Combat Support, and Combat Service Support operations. (2) The AN/PVS-6 MELIOS is a hand-held, eyesafe laser rangefinder with an integrated compass and vertical angle measurement capability. (3) The AN/PVS-10 SNS is an NDI day/night sight specifically procured for M24 Sniper Weapon to replace the Leopold day sight. (4) The AN/PAQ-4 IAL is a lightweight, weapon mounted and boresighted aiming light. The aiming light output is visible only when used with a night vision goggle, such as the AN/PVS-7. (5) The K30400 Horizontal Technology Integration Second Generation Forward Looking Infrared (HTI SGF) (FLIR) will incorporate common second generation FLIR technology into critical, high priority combat platforms. It will enable the Army to insert key technology into the highest priority forces, e.g. M1A2 SEP Abrams, M2A3/M3A3 Bradley Fighting Vehicle System and Long Range Advanced Scout Surveillance System (LRAS3). Through FY99, this roll line also includes K22900 AN/PAS-13 Thermal Weapon Sight (TWS), K38400 AN/PLQ-8 Target Location and Observation System (LRAS3).

JUSTIFICATION: The "Own the Night" initiative, one of the Chief of Staff of the Army's top five priorities, includes the AN/PVS-7/14. The FY99 funds will procure AN/PVS-7/14 systems with the latest technology for fielding to Special Operations and Light Forces (75th Rangers, 82nd Airborne, 101st Air Assault, 10th Mountain, 2nd and 25th Infantry, and Scout Battalions).

*FY97 was adjusted by an increase of \$11.437M that was moved within this parent SSN KA3500 (ie. from baby SSN K38400 to baby SSN K36400). In addition, HQDA reporgrammed \$1.178M from this SSN to a higher Army priority. The database will be corrected to reflect these FY97 adjustments.

DESCRIPTION: K35000 AN/PAQ-4 Infrared Aiming Light (IAL); The AN/PAQ-4 IAL is a lightweight, weapon mounted and boresighted aiming light. The aiming light output is visible only when used with a night vision goggle, such as the AN/PVS-7. This SSN also includes the AN/PEQ-2A Infrared Target Pointer/Infrared Aiming Light, a device originally developed for the U. S. Navy. The AN/PEQ-2A program is managed by the Army.

JUSTIFICATION: No planned program in FY99.

DESCRIPTION: K30800, AN/PVH-1&2 Lightweight Video Reconnaissance System (LVRS) is a system designed to capture and transmit still video images through military radios. The images are captured with a portable AN/PVH-1 LVRS Out Station which transmits the captured image to the AN/PVH-2 LVRS Base Station for analysis and dissemination. This system is a part of roll line KA3500 Night Vision Devices until FY99.

JUSTIFICATION: The "Own the Night" initiative, one of the Chief of Staff of the Army's top five priorities, includes the AN/PVH-1&2 LVRS. The LVRS provides the first day/night image transmission capability between ground scouts and their higher headquarters, facilitating rapid target identification and analysis of key structures/terrain and other data critical to mission planning/execution. The FY99 funds will procure this LVRS capability for fielding to Special Operations and Light Forces (75th Rangers, 82nd Airborne, 101st Air Assault, 10th Mountain, 2nd and 25th Infantry, and Scout Battalions).

DESCRIPTION: K22900, AN/PAS-13 Thermal Weapon Sight (TWS) is a part of the roll line KA3500 Night Vision Devices until FY99. The AN/PAS-13 is a multipurpose Thermal Weapon Sight designed to be mounted on all Infantry Individual and Crew Served Weapons. It is a GEN II Thermal Device which significantly improves dismounted Infantry operation capability by increasing range and enabling both day and night vision through smoke, fog, battlefield obscurants and in extremely low light levels such as under triple canopy jungle.

JUSTIFICATION: The "Own the Night" initiative, one of the Chief of Staff of the Army's top five priorities, includes the AN/PAS-13 TWS. The TWS is also a key component of Land Warrior, a designated digitized division/corps asset. The FY99 funds will procure TWS systems with the latest technology for fielding to the Special Operations and Light Forces (75th Rangers, 82nd Airborne, 101st Air Assault, 10th Mountain, 2nd and 25th Infantry, and Scout Battalions).

Army artillery weapons and increase the probability of first round target hits. This category of equipment included procurement of the Meteorological Measuring System (K27800) and Artillery Muzzle Velocity System (AD3250).

JUSTIFICATION: The FY99 funds support fielded units and readiness requirements with conventional and Paladin versions of the Muzzle Velocity System (MVS), and the Meteorological Measuring System (MMS), providing field artillery weather data.

DESCRIPTION: The Meteorological Measuring System (MMS) provides field artillery weather data to the active Army. It is an upper air meteorological data collection, processing and dissemination system that provides necessary data to field artillery, target acquisition, and air weather service to improve their mission capability. It is mobile, provides high altitude Met Data to USAF Weather Service, radiological fallout data to the chemical sections, meet roll on/roll off HMMWV requirements data to 30KM. The Meteorological Hydrogen Generator (MHG) generates hydrogen and diverts gas to a storage tank for later use; provides up to 6 hours of continuous operation. It is environmentally safe and needs only one operator.

JUSTIFICATION: The FY99 procurement supports fielded units and readiness requirements for the Meteorological Measuring System (MMS), providing field artillery weather data to the active Army.

DESCRIPTION: The Muzzle Velocity System (MVS) Conventional is a Doppler Radar System which measures the muzzle velocity of artillery projectiles. It consists of weapon-mounted antenna connected to a display unit. The display will provide the muzzle velocity of the last round fired. The MVS will also compute weapon calibration data and store that data. A separate Paladin version of MVS is being fielded for use with the M109A6 Paladin Howitzer. It will not require a display and will be integrated into the M109A6 Paladin Automatic Fire Control System. The MVS will enhance artillery accuracy and first round hit probability. This will decrease projectile and propellant usage and reduce the requirements to adjust fire on target. The MVS will also provide an automated method for calculating and storing weapon calibration data. The MVS is being procured as a non-developmental item (NDI) which includes acquisition of provisioning data, manuals, and training, together with the production hardware for fielding and additional related hardware, Muzzle Velocity Communications Adapters (MCA).

JUSTIFICATION: The FY99 procurement supports fielded units and readiness requirements for both conventional and Paladin versions of the Muzzle Velocity System.

DESCRIPTION: Calibration Sets Equipment comprises calibration standards (hardware), accessories, and repair equipment required to perform the Army-wide test, measurement, and diagnostic equipment (TMDE) calibration and repair mission. This equipment provides for accuracy verification of TMDE by maintaining legal traceability to standards established and maintained by the U.S. National Institute of Standards and Technology. The AN/GSM-286 and AN/GSM-287 Calibration Sets and the Reference Calibration Sets are an integral part of the Army calibration system and are used by direct support/general support maintenance units worldwide. This program supports the TMDE required to assure the operability, accuracy, and effectiveness of the Army's weapon systems.

JUSTIFICATION: The Calibration Sets Equipment funding provides for replacement of obsolete and worn-out calibration standards and for procurement of state-of-the-art equipment required to support new and technologically advanced weapon systems such as the Multiple Launch Rocket System, Apache, Bradley Fighting Vehicle, and Patriot. The calibration equipment is required to ensure the Army's weapon systems are maintained in the proper state of readiness.

NOTE: This item is funded in OPA3 beginning in FY 1998.

DESCRIPTION: MOD IN-SERVICE EQUIPMENT (TAC SURV) funds the modifications to the FIREFINDER radars, the AN/TPQ-36 Mortar Locating Radar and the AN/TPQ-37 Artillery Locating Radar. The FIREFINDER equipment is designed to meet the Army's critical need to quickly and accurately locate the large number and variety of hostile indirect fire weapons. The FIREFINDER radars use a combination of radar techniques and computer controlled signal processing to detect and locate enemy field artillery with sufficient accuracy to permit rapid engagement with counterfire. The FIREFINDER radars are capable of locating multiple weapons simultaneously and transmitting the target data to appropriate counterfire elements in near real time. The AN/TPQ-36 is a phased-array X-Band radar which automatically locates mortar and short range rocket launchers. The system is configured on three (3) HMMWVs making it highly mobile and transportable. The AN/TPQ-37 is a larger system requiring a 5-ton truck to pull the Antenna Transceiver Group (ATQ). The AN/TPQ-37 is a phased-array S-Band radar with a longer target acquisition range than the AN/TPQ-36 allowing it to locate long range artillery and rockets.

JUSTIFICATION: FY99 funding completes the installation of the AN/TPQ-36(V)8 Electronics Upgrade modification kits procured in FY96 and FY97. FY99 also initiates procurement of the Fire Support Digitization hardware/software required to upgrade the AN/TPQ-36(V)5/7s and the Active Army AN/TPQ-37s to allow AFATDS connectivity and provide Joint Technical Architecture (JTA)-Army compliance.

INDIVIDUAL MODIFICATION Date February 1998

MODIFICATION TITLE: AN/TPQ-36(V)8 Electronics Upgrade 1-90-07-0016

MODELS OF SYSTEMS AFFECTED: AN/TPQ-36(V)5 and AN/TPQ-36(V)7 HMMWV Radar

DESCRIPTION / JUSTIFICATION:

The AN/TPQ-36 is the primary target acquisition and counterfire system for the field artillery in support of Divisions, separate Brigades, and rapid deployment task forces. This program incorporates the first electronics upgrade to the 1970s technology of this system and corrects Operation Desert Storm identified deficiencies in range, false target rate, target throughput, target classification and displacement time. It replaces electronic components, that are rapidly approaching obsolescence, with standard Common Hardware/Software (CHS) and/or Commercial Off-The-Shelf (COTS) equipment. This Materiel Change provides a validated cost benefit of \$48.933M (FY92 constant dollars) attributed to Operational and Support (O&S) savings over twenty years.

FY99 funding completes the installation of the modification kits procured in FY96/97. FY02/03 funding will procure an additional fifty-five (55) modification kits to complete the Army AAO.

DEVELOPMENT STATUS / MAJOR DEVELOPMENT MILESTONES:

Milestone III was approved in 3QFY96. Full Rate Production contract for eleven (11) modification kits was awarded in 4QFY96. An option for an additional eleven (11) kits was awarded in 2QFY97. Initial Operational Capability (IOC) is scheduled for 3QFY98. Contract award to procure additional modification kits is scheduled for 2QFY02.

MODIFICATION TITLE: AN/TPQ-37(V)7 ATG Mobility Improvement 1-92-07-0027 MODELS OF SYSTEMS AFFECTED: AN/TPQ-37(V)5 and (V)6 DESCRIPTION / JUSTIFICATION: This Materiel Change (MC) was initiated in response to mobility problems encountered during Operation Desert Storm. These problems included excessive wear of trailer tires, difficulty in moving the trailer through sand, and improper tracking of the trailer behind the assigned prime mover. The Antenna Transceiver Group (ATG) Mobility Improvement Program will apply the Medium Tracked Suspension System (MTSS), produced by Caterpillar, to the M-1048 trailer carrying the AN/TPQ-37 ATG. Testing demonstrated that application of the MTSS provides a wider footprint for the M-1048 trailer which improves trailer mobility in off-road use and does not degrade performance on paved surfaces at highway speeds. DEVELOPMENT STATUS / MAJOR DEVELOPMENT MILESTONES: Milestone III was approved in 3QFY94. Production contract for twenty-six (26) modification kits was awarded in 4QFY94. First article testing was completed in 1QFY96. Application/fielding of modification kits began in 2QFY96 and was completed during 1QFY

INDIVIDUAL MODIFICATION Date February 1998

MODIFICATION TITLE: AN/TPQ-37(V)8 Enhanced FIREFINDER Block I 1-93-07-0001

MODELS OF SYSTEMS AFFECTED: AN/TPQ-37(V)5 AND (V)6

DESCRIPTION / JUSTIFICATION:

This Materiel Change (MC) is vital to keeping the AN/TPQ-37 radars sustainable in the field. The MC is limited to mechanical, electrical, and software changes necessary to maintain the Reliability, Availability, Maintainability (RAM), transportability, mobility and interoperability of the system through FY05. The effort will design, retrofit, and qualify modifications to the system as follows: upgrade the cooling system, and provide for transportability by a C130/141, upgrade the trailer, incorporate a self-survey capability, reduce false locations, correct and incorporate existing long range software, improve the transmitter RAM, integrate the AN/TPQ-36(V)7 Operations Control Group (OCG) on M-1097.

Funding in FY02 will procure an additional eight (8) modification kits.

DEVELOPMENT STATUS / MAJOR DEVELOPMENT MILESTONES:

Milestone III was approved in 3QFY94. Production contract for twenty-six (26) modification kits was awarded in 3QFY94. First article testing was completed in 1QFY96. Application/fielding of modification kits began in 2QFY96 and was completed during 1QFY98. Contract awar procure additional modification kits is scheduled for 2QFY02.

INDIVIDUAL MODIFICATION Date February 1998 MODIFICATION TITLE: Fire Support Digitization 1-95-07-XXXX MODELS OF SYSTEMS AFFECTED: AN/TPQ-36(V)5/7 and AN/TPQ-37(V)8 DESCRIPTION / JUSTIFICATION: This upgrade will effect the FIREFINDER Operations Control Group (OCG) and will incorporate hardware and software to allow AFATDS connectivity and will provide JTA-Army compliance. The hardware required will be a Lightweight Computer Unit (LCU) and TACFIRE Control Interface Module (TCIM). FY 99 funding will initiate procurement of the hardware/software required to upgrade the AN/TPQ-36(V)5/7s and the Active Army AN/TPQ-37s. DEVELOPMENT STATUS / MAJOR DEVELOPMENT MILESTONES: A Milestone Decision and Contract Award are scheduled for 1QFY99. First Article Testing and Delivery are planned for 4QFY99. DESCRIPTION: The program provides the Army with the capabilities of ADP support to the Deployed Counterintelligence assets for immediate intelligence information in support of the Land Component Commander.

JUSTIFICATION: Funding is required to support the development and recapitalization of the Defense Counterintelligence Integrated Information System (DCIIS) funds will procure DODIIS-compliant Counterintelligence and Human Intelligence workstations using migration platforms such as the Migration Defense Intelligence The Data System. Funds will support 21 large sites (MACOMs), 52 medium sites (installations and Force Projection Brigades), and 253 small sites (detachments in support EAC and ECB organizations).

DESCRIPTION: The objectives of the Test Equipment Modernization (TEMOD) program are to improve the materiel readiness of Army weapon systems; reduce test, measurement, and diagnostic equipment (TMDE) proliferation and obsolescence; and reduce TMDE support costs. These objectives are accomplished through acquisition of state-of-the-art test equipment to provide new measurement capabilities and to replace obsolete items in the existing inventory of general purpose test equipment at the direct and general support levels. The TEMOD program supports a wide variety of communications and electronics systems, and purchases test equipment that is essential to continued support of the Abrams tank, Bradley Fighting Vehicle, Apache helicopter, Patriot, Single-Channel Ground and Airborne Radio System, and other major weapons and support systems. The TEMOD procurements are primarily commercial items which have a significant impact on the readiness, power projection, safety, and training operations of active Army, Army Reserve, and National Guard units.

JUSTIFICATION: The TEMOD program procures general purpose test equipment to support Army weapons and support systems across all commodities. It has produced significant savings in TMDE acquisitions through centralized, economical procurements. The TEMOD program also reduces the Army's operating and support costs by minimizing proliferation of TMDE makes and models and by replacing obsolete, unsupportable equipment.

NOTE: This item is funded in OPA3 beginning in FY 1998.

DESCRIPTION: The objectives of the Test Equipment Modernization (TEMOD) program are to improve the materiel readiness of Army weapon systems; reduce test, measurement, and diagnostic equipment (TMDE) proliferation and obsolescence; and reduce TMDE support costs. These objectives are accomplished through acquisition of state-of-the-art test equipment to provide new measurement capabilities and to replace obsolete items in the existing inventory of general purpose test equipment at the direct and general support levels. The TEMOD program supports a wide variety of communications and electronics systems, and purchases test equipment that is essential to continued support of the Abrams tank, Bradley Fighting Vehicle, Apache helicopter, Patriot, Single-Channel Ground and Airborne Radio System, and other major weapons and support systems. The TEMOD procurements are primarily commercial items which have a significant impact on the readiness, power projection, safety, and training operations of active Army, Army Reserve, and National Guard units.

JUSTIFICATION: The TEMOD program procures general purpose test equipment to support Army weapons and support systems across all commodities. It has produced significant savings in TMDE acquisitions through centralized, economical procurements. The TEMOD program also reduces the Army's operating and support costs by minimizing proliferation of TMDE makes and models and by replacing obsolete, unsupportable equipment.

NOTE: This item is funded in OPA3 beginning in FY 1998.

DESCRIPTION:

The Mobile Subscriber Equipment (MSE) Modification in Service Line funds for high priority Echelons Corps and Below (ECB) system improvements.

JUSTIFICATION:

The ECB portion of the Area Common User System-Modernization Plan (ACUS-MP) has been moved to the ACUS MOD Program (WIN - T) SSN BB1600 FY 98 and beyond.

NARRATIVE: The Battlefield Combat Identification System (BCIS) is an all weather, day/night, millimeter wave, Low Probability of Intercept/Low Probability of Detection (LPI/LPD), digitally encrypted question and answer system that provides positive identification of friendly platforms out to 5.5 km (clear weather). BCIS was developed to minimize fratricide while maximizing combat effectiveness given the rapid shoot/don't shoot decision at the point of engagement. BCIS also provides short range (out to 1 km, in clear weather), situational awareness messages at the platoon level. Any situational awareness received by BCIS will be sent to the Applique for integration with other position sources to form the full situational awareness database.

<u>JUSTIFICATION</u>: Performance results from the Army TF XXI AWE indicate that situational awareness (SA) in its current form is insufficient to prevent fratricide by itself, thus a Target Identification (TI) capability is required. FY99 funding is required to initiate production for fielding to selected units of the Army's 4th ID in order to comply with Chief of Staff, Army plan to field to a digitized division. FY99 funding includes the cost of initial hard tooling and production line set-up to support low rate and full scale production of the system. FY99 also provides for sufficient quantities to conduct Production Verification Test (PVT).

DESCRIPTION:			•	•	•	•	•	•	•	•		

DESCRIPTION:

Provides Joint Staff directed Army share of funds to equip the Joint Communications Support Element (JCSE). The JCSE is a unique, completely mobile, multi-service communications unit which provides support to the Unified and Specified Commands at the direction of the Joint Staff. The JCSE has the capability to deploy to any location and provide simultaneous communications support to two Joint Task Force (JTF) Headquarters and two Joint Special Operations Task Force (JSOTF) Headquarters involved in worldwide contingency operations or disaster relief/evacuation activities. JCSE also augments or provides contingency emergency communications support to meet the critical operational needs of the Joint Staff, the Services, defense and/or civil agencies, etc. and on a non-interference basis, provides communications support for joint readiness exercises. Equipment to be procured includes wideband microwave radio systems, packet switching nodes, line termination modules for Echelons Above Corps switches, Demand Assigned Multiple Access satellite radios, MILSTAR radios, Asychronous Transfer Mode (ATM) switching nodes, and upgrades to existing systems.

JUSTIFICATION:

Equipment requirements are approved annually by the JCS and assigned to the respective Services for procurement through the Executive Acquisition Agent (ARMY)

DESCRIPTION: The Defense Satellite Communications System (DSCS) provides super high frequency (SHF) wideband and anti-jam (AJ) satellite communications supporting critical national strategic and tactical C3I requirements. It must be survivable during trans- and post- nuclear attack to support communications essential to national survival. The DSCS supports the Army warfighter as well as the unique and vital Department of Defense (DOD) and non-DOD users, as approved by the Joint Staff and/or Secretary of Defense (SECDEF). The DSCS is used in conjunction with the Terrestrial Transmissions of the Defense Information System Network (DISN) and other communications systems to provide end-to-end communications. The DSCS provides long-haul service between the Continental United States (CONUS) and overseas locations.

JUSTIFICATION: Funds are required to support various requirements as directed by the National Command Authorities (NCA), Commanders in Chief (CINCs), White House Communications Agency (WHCA), Navy C2, NATO, UK, and Diplomatic Telecommunications Service (DTS).

FY99 JRSC funds will provide for the continued acquisition of the Universal Modem System (UMS). FY99 Mod of In-Service equipment funds provide for continued installation and fielding of the Heavy/Medium Terminals' (HT/MT) MWO kits and AN/GSC-52 installation kits. FY99 DSCS Operations Control System (DOCS) funds complete the procurement of the Replacement Satellite Configuration Control Element (RSCCE) program and continues procurement of Operational Databases. FY99 Digital Equipment funds will provide for continued fabrication of racks and components and their integration into DSCS. FY99 Interconnect Facility (ICF) funds will continue to accomplish DISA and JCS directed satellite ground terminal relocations supporting realignment of U.S. forces worldwide. In addition, FY99 funds annualized engineering, matrix, and fielding support for current and prior year DSCS procurements.

DESCRIPTION: The Defense Satellite Communications System (DSCS) is a subset of the entire Defense Communications System (DCS). The Army DSCS provides research, development, and procurement of the ground segment portion of all strategic satellite communications systems. This equipment accepts voice frequency and digital data from other terrestrial ground systems, i.e., telephone, telephone switching centers, Defense Data Network (DDN), Defense Switched Network (DSN), Secure Voice Communications and microwave; and converts the aggregate user signals into a digital signal which is then transmitted to its recipients utilizing DSCS satellites that are in geostationary earth orbits for worldwide coverage. This long haul strategic military communications system utilizes equipment that makes maximum use of multiplexing, modulation, and coding techniques in order to maximize satellite utilization. This equipment is integrated into the Digital Communications Satellite Subsystem (DCSS) which is a system of electronic racks integrated into a vanized or fixed configuration. Each system is tailored to the individual user earth terminal requirements.

JUSTIFICATION: The DSCS Program must be sustained through the year 2010 to support projected future operational needs. A sustainment program has been established for the DCSS to increase supportability and efficiency while decreasing space, power, and personnel requirements. FY99 funds will provide for fabrication of racks and components and their integration into the DSCS. Primary emphasis is the fabrication of racks in support of Jam Resistant Secure Communications (JRSC), and global Tri-Service Frequency Division Multiple Access (FDMA) earth terminal communications requirements scheduled for installation during this period. These JRSC racks and FDMA racks provide the maximum efficiency in long-range communications by integrating all digital communications network control, and anti-jam secure communications in one system. Another DCSS priority is the procurement of the Integrated Baseband Work Station, which reduces O&M costs by providing centralized equipment configuration, control, and monitoring. The DCSS also provides for the fabrication of racks and equipment to field the Strategic/Tactical Gateways, the primary means of interoperable communications providing tactical warfighters

DESCRIPTION: This program executes the Army's executive agency responsibility to install and relocate strategic DSCS satellite communications earth terminals procured by Product Manager, Defense Satellite Communications System (DSCS) Terminals and digital communications equipment procured and packaged by Space & Terrestrial Communications Directorate. For the Army, this program also designs, procures and installs the interconnection facility to interface this equipment with existing technical control and special user facilities.

JUSTIFICATION: FY99 funds buy equipment in support of Defense Information Systems Agency (DISA) and Joint Chiefs of Staff (JCS) directed satellite ground terminal relocations supporting the realignment of US Forces worldwide. Reduced overseas manning and the refocus of US interests to areas such as Southwest Asia requires a major shift of key strategic satellite ground resources to support new areas of interest and troop dispositions. Additionally, sustaining the Defense Satellite Communications System (DSCS) systems requires marginal systems to be replaced by newer equipment made available by US troop withdrawals from Europe and other areas. In addition, the FY99 program has been increased IAW AMC policy decision to fund all PM costs from the Procurement program.

DESCRIPTION: The Jam Resistant Secure Communications (JRSC) provides communications connectivity that will survive jamming and high altitude nuclear events which cause High-Altitude Electromagnetic Pulse (HEMP) and other perturbed atmospheric conditions. JRSC requirements are characterized by a combination of new and existing satellite equipments. They include: AN/GSC-52, JRSC Satellite Terminals AN/GSC-49, AN/USC-28 Spread Spectrum Multiple Access Equipment including Mitigation Modifications, the Universal Modem System (UMS), Replacement Satellite Configuration Control Element (RSCCE) and the Service Life Extension Program (SLEP). In FY99, the UMS is the only funded program. The other identified anti-jam systems have already been acquired. The UMS will enable strategic and tactical forces under the command of the U.S., U.K., France and NATO to have interoperable voice and digital data satellite communications capability under jamming and nuclear scintillation, while using non-processing transponders of the DSCS III, NATO or SKYNET 4 satellite systems.

JUSTIFICATION: The FY99 funds are for the acquisition of the Universal Modem System (UMS). Fifty six (56) UMS's of various configurations will be acquired in FY99.

DESCRIPTION: The Defense Satellite Communications System (DSCS) Operations Control System (DOCS) provides for the management of DSCS earth terminal and satellite resources, which is required for rapid and efficient reaction to operational needs in support of the warfighter. DOCS is made up of a number of semi-automated subsystems which configure, monitor, maintain, and restore all communications links, and automatically control operations over these links. The Objective DSCS Operations Center (ODOC) will modernize the existing DOCS subsystems to provide improved satellite communications to Ground Mobile Forces and Strategic users. It will replace the existing (largely manual) control system, provide greatly enhanced responsive system control, reduce the number of personnel required, and increase overall system availability. DOCS supports control of the satellite payload, satellite communications network planning, satellite communications link performance monitoring, and control of ground satellite terminals. DOCS assures reliable satellite communications networks to support unique user mission requirements vital to national security under stressed and unstressed conditions.

JUSTIFICATION: Funding supports the ODOC Operational Requirements Document (ORD) approved by DA 31 Jan 96. FY99 funds procure the remaining Replacement Satellite Configuration Control Element (RSCCE) quantities and the Objective DSCS Operations Center (ODOC) workstations. The RSCCE is required to provide real-time monitoring and control of the DSCS III satellite platform and communications payload. The acquisition of the ODOC workstations is required for ODOC to comply with the Army Technical Architecture and the Common Operating Environment. In addition, FY99 funds procure Operational Database, DOCS Training System (DTS), and the Smart Multi-Channel Circuit Terminal (SMCT) software. Operational Databases are required for command and control of DSCS III satellites. DTS software is used to train Fort Gordon Signal School personnel on the DOCS subsystems. The SMCT software is required to provide automated message processing with archival storage capabilities for the terrestrial orderwire circuits with the earth terminals. FY99 will also fund the first Replacement BATSON (RBATSON) and Radio Frequency Interface System (RFIS) production units. RBATSON is required to provide security, authentication, and anti-jam waveform protection to satellite

Appropriation / Budget Activity/Serial No. OTHER PROCUREMENT / 2 / Communications and Electronics Equipment DSCS - OPERATIONS CONTROL SYS (DOCS) (SP (BB8509)) Program Elements Code Other Related Program Elements commands received by the RSCCE for transmisson to DSCS III satellites. RFIS provides the interface connection between the DSCS Control equipment and the colocated Earth Terminal. The upgrade is required to improve operational performance, as well as adding additional ports to accommodate the Universal Modem and ODOC architecture. Finally, FY99 funds annualized engineering, matrix, system integration, and fielding support of current and prior year procurements.

DESCRIPTION: These modifications will modernize the aging heavy terminals (HT), medium terminals (MT) so that all Defense Satellite Communications System (DSCS) Super High Frequency (SHF) strategic earth terminals use common electronics and logistics support. The result will extend the life of the terminals, increase readiness, reduce training and logistics support, conserve energy and improve maintainability. In addition, a modernization effort is planned for the AN/GSC-52 System which will eliminate system obsolescence, modernize existing equipment and provide component commonality with other existing strategic terminals.

JUSTIFICATION: FY99 funds are required to continue the installation/fielding of the HT/MT modification work order (MWO) kits. FY99 funds are also required to procure the first option for the AN/GSC-52 installation kits and complete the acquisition of AN/GSC-52 vans and AN/GSC-52 components that are common to the other DSCS satellite terminals.

INDIVIDUAL MODIFICATION Date February 1998 MODIFICATION TITLE: AN/GSC-52 Modernization 1-89-07-0030

MODELS OF SYSTEMS AFFECTED: AN/GSC-52 Modernization

DESCRIPTION / JUSTIFICATION:

The modernization effort of the AN/GSC-52 System will eliminate obsolescence, modernize the existing equipment and provide commonally with other existing terminals. The acquisition strategy consists of a two contract approach. In FY97, components which are common to AN/GSC-39 and AN/FSC-78/79 terminals were purchased from an existing contractual vehicle as a cost effective means to insure compor commonality for these DSCS Terminals. Another contract will be awarded in FY98 for the production of installation kits and installation of the AN/GSC-52 hardware. The guidance was directed by DISA DSCS Program Plan FY93-98, dated January 1994. FY98 funds are required to begin procuring the installation kits and software for the AN/GSC-52 Modernization effort. FY99 funds continue the acquisition of AN/GSC installation kits and complete the procurement of common components.

DEVELOPMENT STATUS / MAJOR DEVELOPMENT MILESTONES:

FY99 funds are required to continue the acquisition of AN/GSC-52 installation kits and complete the acquisition of common components.

INDIVIDUAL MODIFICATION Date February 1998 MODIFICATION TITLE: Terminal Modernization 1-89-07-0005 MODELS OF SYSTEMS AFFECTED: AN/FSC-78/79, AN/GSC-39, and AN/TSC-86 DESCRIPTION / JUSTIFICATION: The AN/FSC-78/79 Heavy Terminal (HT), AN/GSC-39 Medium Term (MT) began operation in the mid-70's & have surpassed their 15 year design life. The original systems were fielded with a required Mean Time Between Failures (MTBF) of 1,000 hours. Due to aging, the MTBF degraded significantly. The Terminal Mod program will eliminate system obsolescence and enable the terminals to achieve the required 1 hours MTBF. The contract was awarded in Mar 92 for this modernization effort, which will provide for upgrading of aging electronics in HT/ satellite earth terminals so all Defense Satellite Communications Systems (DSCS) Super High Frequency (SHF) strategic earth terminals wi use common electronics & logistics support. The result will extend the life of the terminals for another 15 years, enhance operational readiness, reduce training & logistics support, conserve energy & improve maintainability. This Tri-Service DOD Program was approved in the FY91-95 DSCS Program Plan, Jun 89. FY99 funds are required to complete installation/fielding of the Terminal Mod Program. DEVELOPMENT STATUS / MAJOR DEVELOPMENT MILESTONES: No development required. DESCRIPTION: Army Training XXI Modernization uses information technologies to enhance the planning, preparation and execution of individual, (Warrior XXI), collective (Warfighter XXI), and new equipment training (Warmod XXI). It will electronically link Army's master instructors/subject matter experts to soldiers anywhere in the world, to improve performance and create a virtual classroom. Army Training XXI will evaluate evolving training technologies developed by industry/academia for deployment as they enter the commercial main stream. Army Training XXI Modernization will leverage existing and future national communications infrastructure. Infrastructure acquired will be based on industry standards and compliant with the Joint Technical Architecture (JTA) and Defense Information Infrastructure Common Operating Environment (DII COE), where applicable. This will help assure not only compatibility with other military services but also that commercial, state, and other resources can be leveraged to achieve cost effective solutions to support the Total Army. Specific initiatives include Distance Learning/Classroom XXI (DL/CR XXI), Army Training Digital Library, Automated Instructional Management System - Redesign (AIMS-R), and Standard Army Training System (SATS).

Warrior XXI - Warrior XXI initiatives include Distance Learning (DL) and Classroom XXI (CR XXI). This effort is critical to sustain soldier/unit proficiency. The Army is and will remain primarily CONUS-based with disbursed smaller units strategically placed worldwide. For the foreseeable future, the Army will perform a far larger array of missions than in the past. Meanwhile, personnel reductions will make it increasingly difficult to provide Mobile Training Teams and New Equipment Training Teams to meet training requirements. DL and CR XXI provide infrastructure to implement a cost effective solution to this problem, aiding Army to maintain acceptable outyear readiness levels despite massive resource reductions. DL/CR XXI supported training enhancements will help reduce the current backlog of over 90K soldiers that require MOS training (47K of whose schooling is not currently programmed for). It will reduce the cost of these efforts by 20% or more. Army can significantly increase levels of MOS qualification, hence readiness, with standardized, Total Army courseware delivered through DL technology. Aggressive implementation of the Army Distance Learning Plan (ADLP) will also help compensate for the impact on the outyear training backlog of the redesign of National Guard divisions and

	Α		

decreases in overall Army resource levels. DL wil reduce resident training requirements and soldiers will spend less time in the training base and more time in units, thereby increasing readiness. DL and CR XXI provide the infrastructure needed to achieve these goals. Without this investment, Army schools will be unable to export the expertise and standardization provided by master instructors and subject matter experts; the full benefits of Total Army courseware already updated or currently being updated will not be realized; soldiers will not be able to receive training where and when needed; and the problem of training backlog will be exacerbated.

DL/CR XXI infrastructure will deliver standardized training to Active (AC) and Reserve (RC) Component soldiers world-wide. DL provides infrastructure for soldiers to train at or near their assigned station, in lieu of resident training at Army schools. CR XXI provides infrastructure at sites collocated with Army schools. Operational implementation of DL/CR XXI infrastructure is carefully phased to coincide with development of updated Army courseware, taking into account the number of soldiers needing training, types of training needed, and where training is needed to maximize the return on the DL/CR XXI investment. Tasks supported include conducting training, receiving training, developing training, and storing digitized training materials.

The DL/CR XXI acquisition strategy will follow a multi-phase implementation approach to achieve these objectives. FY98/99 investments will provide an interim capability. It will support and enhance existing Army training capabilities based primarily on a synchronous training model to provide an immediate return on investment. Concurrently, Army will team with industry and academia to develop an overarching functional and technical architecture to support the evolution of the ADLP into the objective Army training model. This model will be based on an optimized mix of synchronous and asynchronous learning techniques. Beginning in FY00, Army will begin acquiring DL/CR XXI infrastructure to both enhance capabilities provided in FY98/99 and to support development/acquisition of learning tools based on the objective Army training model. This investment will leverage advances in information technology and learning theory to make training more available/affordable for the total force and improve overall readiness.

Warfighter XXI - Warfighter XXI initiatives include the Army Training Digital Library (ATDL), the Automated Instructional Management System - Redesign (AIMS-R), and the Standard Army Training System (SATS). Warfighter XXI initiatives support DL/CR XXI through the Warfighter XXI Campaign Plan. The Warfighter XXI Campaign Plan provides a strategic vision and an integrated plan for how the future Army will train battle staff and collective tasks. Result will be an automated training management system designed to enhance the planning, resourcing, execution, and assessment of battle-focused training for the unit and unit commander. The ATDL stores the data and provides unit and institutional commanders access to data necessary to plan, resource, execute, and assess training.

JUSTIFICATION: FY99 funds allow acquisition of interim Warrior and Warrior XXI infrastructure to augment and enhance existing Army training capabilities based primarily on a synchronous training model. This allows an immediate return on investment while design efforts on the objective Army training model are completed.

DESCRIPTION: This budget line supports the Army's sustaining base automation systems. The Army's primary sustaining base information management (IM) goal is to provide information services for the sustainment and readiness of the forces at minimum cost.

JUSTIFICATION: The current sustaining base automation infrastructure is largely overstressed and reaching technological obsolescence. A stable modernization program is essential to maintain efficiency, increase productivity, and reduce operation and maintenance costs through technological advancement. As the Army modernizes its warfighting forces for the twenty-first century, it must leverage the use of automation technology to streamline and modernize its management information systems to support C4I for the Warrior and power projection strategies, split base operations, and downsized force structures. The effectiveness of the CONUS split base operations strategy to perform as the rear area for deployed forces as well as the mobilization, force projection, and redeployment platform is increasingly dependent upon use of state-of-the-art automation technology to provide responsive combat service support to the warfighter in the areas of command and control, logistics, personnel, finance, transportation, medical and other sustaining base functions.

DESCRIPTION: This budget line supports high payoff initiatives to replace obsolete, inefficient records management systems with state-of-the-art optical digital equipment and other electronic recordkeeping systems. This technology will reduce operations and maintenance costs and improve the mission effectiveness and productivity of records managers throughout the Army.

PERSONNEL ELECTRONIC RECORD MANAGEMENT SYSTEMS (PERMS): PERMS provides an electronic system for the maintenance of military personnel files at headquarters level Army Personnel Records Management Centers for Active Army, Army National Guard, and Army Reserve. PERMS, has and will continue to convert current paper and microfiche personnel files to digital images. PERMS will allow for selective retrieval of individual files, groups of files or individual documents within these files. Retrieval selections can be individually tailored to the needs of the soldier, their personnel managers and selection/promotion boards.

DOCUMENT IMAGING PROCESSING SYSTEMS: This budget line ensures Army compliance with Code of Federal Regulations (CFR) 36 and 41 for economy and efficiency in documenting Army business. This program fields replacement for obsolete equipment at 63 installations which reproduce and distribute Standard Army Management Information System (STAMIS) reports (Personnel, Finance, Logistical, Medical etc.) and Base Operating Reports on microfiche. This program processes 8 billion pages per year, thus avoiding \$100 million in paper costs. It is the key support for on going imaging applications, including costs for software licenses.

JUSTIFICATION:

PERMS: FY 99 funds support reengineering and upgrade of PERMS hardware, remote access and Year 2000 upgrades.

DOCUMENT IMAGING PROCESSING SYSTEMS: FY 99 funds procure document imaging and joint multi-media information processing systems. Funds will procure hardware, software and the peripherals necessary to provide various installation data processing centers with the capability to link with existing Defense Mega Center technology. This program will maximize utilization of the Mega Centers and avoid significant potential operation and maintenance costs in the future.

DESCRIPTION: This budget line supports the Total Distribution Program (TDP), an initiative to correct deficiencies in the distribution of materiel, equipment, personnel replacements, and mail, which occurred during Operation Desert Shield/Storm, and to lay the foundation supporting Force XXI and Log Advanced Warfighting Exercises (AWE). Lessons learned during Desert Shield/Storm, revealed that the materiel distribution system suffered from chronic problems. Multiple duplicate orders for supplies and spare parts caused backlogs at ports in CONUS and in the theater of operations. Over 25,000 containers, out of the 40,000 shipped, had to be opened to determine contents. The resulting shortage of spare parts and supplies in the theater area caused otherwise repairable equipment to be deadlined. The purpose of the TDP initiative is to develop an effective distribution pipeline with Total Asset Visibility (TAV) from initial shipping point to destination. Critical corrective actions include development and fielding of communications capability for logistics, the use of emerging technologies to enhance visibility and material accountability, upgrade of critical distribution management systems, fielding and maintenance of the required distribution infrastructure, as well as doctrinal changes in distribution management. The Vice Chief of Staff, Army (VCSA) approved Total Distribution Action Plan (TDAP) has identified 140 problem areas with milestones for implementing corrective actions. The TDP supports "Improving Logistics Support in Combat Zones" and the Army Strategic Logistics Plan.

JUSTIFICATION: FY 99 funding develops communications capability for transmission of logistics information both within a theater of operations and between the theater and the sustaining base. Work is underway to interface the Tactical Packet Network (TPN), which operates in the tactical environment, with the communications architecture of sustaining base systems, enabling the warfighter to pass data directly to the sustaining base. During the Gulf War, lack of such communications capability was a critical deficiency, which hampered the distribution process. In addition, programmed funds will support the procurement of Automatic Identification Technology (AIT) such as Radio Frequency (RF) Tags to provide source data automation. RF Tags are used for "inside the -box" visibility of container contents and to track critical material throughout the distribution pipeline.

DESCRIPTION: USA RESERVE INFORMATION MANAGEMENT MASTER PLAN (USAR IMMP): USAR IMMP provides automation support for Headquarters, US Army Reserve Personnel Center (ARPERCEN) missions, to include providing for Total Army mobilization with trained personnel through command and control, providing life cycle personnel management for Army reserve soldiers and providing personnel services and administrative support to Army Veterans. The Total Army Personnel Data Base (TAPDB) Reserve is the "Top-Of-The-System" central repository of Reserve Personnel data in support of the Army's Personnel Enterprise System. ARPERCEN is responsible for providing the data necessary for the implementation of the Reserve Component Automation System (RCAS), developing interim interface systems that support phased fielding of RCAS, and developing end-state interfaces between TAPDB-Reserve and RCAS.

JUSTIFICATION: FY 99 funds support the US Army Reserve Transformation which calls for improved economies and efficiencies in USAR Personnel Management. This plan calls for increased automation support to accomplish a reduction of 413 personnel (25% reduction) in conjunction with the establishment of a new Reserve Personnel Command. Program funding will be key in meeting this goal, continuing the migration of Reserve Business Processes to a client server environment. This migration includes the integration of imaging (Personnel Electronic Records Management System (PERMS)) and networked workstations, in support of personnel and mobilization systems critical to warfighting, accountability, interoperability and veterans.

DESCRIPTION: This budget line supports the Scaled Model Signature Measurement Facility (SMSMFAC) within the Intelligence and Security Command (INSCOM). The SMSMFAC laboratory develops signature information that is vital to the development, testing, fielding, and reprogramming of present and future smart sensor and munitions systems.

JUSTIFICATION: FY 99 funds procure equipment for a target stage, a target stage controller, a High Frequency (HF) spectrum analyzer, microwave intermediate frequency stages, heterodyne systems and a carbon dioxide laser system.

DESCRIPTION: This program satisfies critical needs for advanced computational technology for Army scientists, engineers and analysts, and represents the leading edge of high speed processing. This capability is not available through other technology and is designed to solve problems which cannot be resolved in other ways. The program provides for access to Supercomputing resources consisting of networked Supercomputers at various CONUS locations. Supercomputer systems are required to satisfy critical research and development missions in combat and material development programs. Significant advances in supercomputer technology have provided increases in both speed and memory. This is essential for performing fully time-dependent, three-dimensional computations and simulations directed at major new weapon designs or battlefield management. The resultant use of this advanced high-performance computing technology is the generation of very large data sets. In order to effectively and efficiently process this data, robotic mass storage systems are required. Examples of the major Army applications best suited to supercomputer technology include battlefield management, modeling/simulation, weapons systems design, terrain analysis, mechanical design (structural and dynamic vehicles), nuclear survivability, and material dynamics and composition. Supercomputers are contributing to efforts for high leverage, high payoff programs which exploit technological advances, reduce logistics burden, lower acquisition and O&M costs, and provide required lethality at reduced weight and volume.

JUSTIFICATION: FY 99 funds provide local site and Army specific automation infrastructure in order to allow for the effective use of the Army Research Lab (ARL), which is one of four designated DOD Major Shared Resource Centers (MSRCs). Funding will procure mass storage, work stations, and network connectivity for Army users of the ARL MSRC and its associated Distributed Centers. The DOD High Performance Computing Modernization Program (HPCMP) is currently spending over \$200M on the Centers but is not providing any funding for service specific infrastructure. Funds will leverage these assets being procured through the DOD HPCMP and capitalize on leading edge technology in multi-terabyte mass storage systems.

DESCRIPTION: This budget line includes a number of information systems that support Army headquarters worldwide. These systems are included in Army's Modernization Plan.

JUSTIFICATION:

HQDA ADPE: Provides for information management support to HQDA across the entire IM Spectrum. It includes initiatives approved by a joint Office Secretary of Army/Army Staff (OSA/ARSTAF) senior planning group. FY99 funds buy IM support including file servers, Local Area Networks (LANs), multipurpose workstations, stand-alone end-user devices, other peripherals and decision support systems. These funds will also purchase a correspondence tracking system, which will provide a flexible, integrated, automated system to support the control and management of actions, correspondence, filed documentation, executive requests and internal actions that will satisfy the needs of organizations within the HQDA staff. Future funding will also procure equipment for the USA Concepts Analysis Agency ADP Modernization Project, which will enable the Army's principal theater-level study agency to perform quick reaction analyses for the Army Staff, MACOMs and OCONUS commands. These acquisitions will continue to improve the productivity of the senior leadership and their staffs located within the National Capital Area through improved access to functional and decision-level information. These decisions impact force structure and modernization, logistics, personnel, finance and every functional area of the Army.

LEGAL AUTOMATION ARMY-WIDE SYSTEM (LAAWS): LAAWS is an approved STAMIS for Army law offices. It supports automated research and preparation of legal advice to Army commanders, form brigade though HQDA level, on the target selections, treatment and classification of refugees and prisoners of war, military operations in occupied areas, international treaties, Law of War, etc., and assists individual soldiers with legal readiness matters. LAAWS produces different types of legal documents, including wills and powers-of attorney. It supports automated legal research, electronic mail (through DDN connectivity), the processing and management of claims for/against the Army and the electronic distribution of legal materials. FY99 funds provide for the acquisition of LANs, CD-ROM dirves, software and other peripheral equipment required to support Army law offices' automation standardization and development of an Armywide legal resources network. Automation of law offices is a critical step required to offset the effects of the Army drawdown on legal personnel. It will enable the legal staff to continue protecting Army's interests in civil/environmental litigation, procurement fraud, and other legal claims areas. This effort is made even more urgent by today's military involvement in multinational peacekeeping/humanitarian efforts.

(Continuation)

ARMY MODEL IMPROVEMENT PROGRAM (AMIP): AMIP is designed to improve the Army's analytic capability by providing a consistent basis to support decision making affecting force structure, doctrine, and procurement. AMIP directly supports Principle 10, Exploit Modeling and Simulations, of the Army Enterprise Strategy. By using state-of-the-art hardware and new software technology, AMIP will develop an integrated family of computerized combined arms combat models with supporting data bases. These models will support studies, research, and training. Component models will be interfaced and tested for validity and consistency of representations and results. The FY99 funds will procure state-of-the-art computer simuation and graphics equipment/software. The equipment will be used by numerous analysis agencies, MACOMs, and national laboratories to develop more efficient, cost effective, realistic scenarios and real-time simulations of complex combat and associated processes for analysis of data. The achievement of these goals will provide readily understood, valid, and more responsive input into the decision making process affecting weapons procurement, force development, force deployment, tactics, sustainment, and enhance the overall warfighting capability of the Army. The funds will also provide for the upgrading of existing simulations/support equipment and software.

HOUSING OPERATIONS MANAGEMENT SYSTEM (HOMES): HOMES is a standard management system designed to provide efficient processing of soldiers' housing needs. It consists of five subsystems: Family Housing Assignments and Terminations (A&T) for assignments to government housing, Community Homefinding Relocation Referral Services (CHRRS) for help in locating off-post housing, Billeting (BIL)/Lodging supports transient billets, Fisher houses, guesthouses, BOQs & SBEQs, Furnishings Management (FURN), and Headquarters Support (HQ HOMES) increases availability of housing services, housing utilization, housing inventory control, control of Basic Allowance for Quarters (BAQ), upward reporting needs, and elimination of the housing questionaire survey process. The five subsystems are fully deployed worldwide. HOMES has been identified as a critical element of the Army Family Action Plan to improve the level of housing services to soldiers and families. The system operates on INTEL 310/320's, AT&T 3B2, and HP9000 minicomputers, located in the local housing offices. FY99 funds will be used to purchase replacement equipment for the A&T/CHRRS/SA subsystem. The equipment included will be computers, printers, high speed batch printers, and communications equipments. HOMES is a centrally managed system, where all software is developed and all equipment is identified, tested and approved centrally. Since initial fielding of HOMES, Army installation Housing Offices have become dependent on the system to fulfill their mission--management of Army housing inventory and its military occupants. The current reassignment of Army units and concomitant relocation of personnel is too large an activity to be managed without an automated information system. An equipment failure effectively closes a housing office operation. The re-engineering focuses on improving efficiency of operations. The re-engineered system will be Windows NT based and conform with the directions promulgated in the Army Technical Architecture (ATA) and the DoD Technical Arc

STRATEGIC C2 FACILITIES: Provides funds for the Army Operations Center (AOC) and the Command and Control Support Agency. Funding is necessary to maintain state-of-the-art information management capability for the senior leadership of the Army and to obtain a completely integrated, multi-level security system with full connectivity to DOD's Global Command and Control System (GCCS). The system currently includes an Information Processing System with a variety of work-stations; a Local Area Network (LAN - over 250 users); an Automated Message Handling System (AMHS); and a Briefing Display and Support System (BDS), and application tools to manage Army readiness, mobilization, and deployment data. A fully integrated desktop with user friendly tools and access to most Army and DOD databases is a key AOC goal. The system supports every crisis action involving the Army and allows the senior Army leadership and ARSTAF action officers to quickly access, manipulate, display, brief and send command and control directives and mission essential information. The system supports day-to-day operations within the Army Operations Directorate, as well as all crisis actions and JCS exercises. FY 99 acquisitions include critical components (flat screen displays, and LAN hubs, routers, concentrators and development of new software) for the LAN and BDS to improve system reliability, enhance system management capabilities, and ensure complete compatibility with AGCCS, GCCS and other joint staff initiatives.

SITE R INTEGRATION PROGRAM (SRIP): The Army, as the Executive Agent for the Alternate Joint Communication Center (AJCC) at Site R, has responsibility to maintain and replace as needed the AJCC Information Management Infrastructure, and ensure the integration of new and improved systems planned for the AJCC. The AJCC includes communications facilities at Site C, Site RT and the underground facility at Site R and is the home to the Alternate National Military Command Center (ANMCC). FY-99 funds will support the complete integration of an alternate Communications Path from Site R to the facility at Site C. This includes engineering, procurement of materials, installation, testing and securing of a Right of Way along public and private properties. Funding will also be used to procure and install a secure Local Area Network (LAN) to provide Site-R tenant access to the Defense Department Secure Internet Protocol Routing Network (SIPRNET).

DESCRIPTION: This budget line supports automation systems requirements of Major Army Commands (MACOMs) and field activities not included in other centrally managed programs. These requirements conform with the Army's Information Management (IM) Architecture and are included in MACOM IM Modernization Plans. Funding has been programmed to accomplish high priority/high payoff initiatives which offer efficiencies and improvements in mission support and reduce operations and maintenance costs. Acquisitions will be accomplished primarily through standard requirements contracts.

JUSTIFICATION:

MACOM AUTOMATION SYSTEMS: FY 99 funds support systems modernization/life cycle replacement throughout Forces Command (FORSCOM), US Army Europe (USAREUR), Training and Doctrine Command (TRADOC), Army Materiel Command (AMC), Military District of Washington (MDW), Eighth US Army (EUSA), US Army Pacific (USARPAC), US Army Recruiting Command (USAREC), Army Signal Command (ASC), Army War College (AWC), and Intelligence and Security Command (INSCOM). Acquisitions include hardware, software, networking products, and peripherals that are required for MACOM/end user level systems architecture and the transition to an open systems environment (OSE). These systems perform vital functions throughout the sustaining base, and modernization is essential to accommodate growing information processing requirements with declining manpower resources. Due to increased emphasis on expense/investment criteria for IM acquisitions, this budget line reflects MACOM funding realignments (OMA/OPA transfers) to ensure investment items are budgeted in the correct appropriation. In addition, OPA funding is necessary to provide life cycle replacement of obsolete information processing equipment (IPE), which will eliminate excessive maintenance costs and facilitate productivity growth through advances in information systems technology, thus streamlining manpower intensive operations. Funding will also support MACOM efforts to reengineer business processes, infrastructure to support leaner organizations, and the total compatibility and interoperability needs of a force projection Army. All acquisitions have or will be supported by MACOM Information Requirements Studies and documentation in the MACOM IM Modernization Plans, all conforming with the Army's IM Architecture.

(Continuation)

ARMY ELECTRONIC COMMERCE (EC): Army Electronic Commerce synthesizes the benefits of business process re-engineering and the migration from aged paper-based business processes to fully electronic processes. Using streamlined and technically innovative business practices, Army EC unites all functional areas into a cohensive electronic business network. Army EC implements Executive direction for the Federal Government and Defense Services/Agencies to implement Electronic Commerce globally. Army EC complements other Defense-wide efforts such as the Defense Reform, Paperless Acquisition, and the Joint Computer-aided Acquisition and Logistics Support. By conducting business electronically, the Army will be able to expedite normal business transactions, particularly during surges associated with military mobilization. Army EC helps create the digitized power projection platform necessary for the sustainment of the Army's digitized battlefield through electronic commerce with its Industrial Partners. Army EC supports pilot projects as "proof-of-concept" of EC technologies applied to re-engineered business processes. FY99 funds will acquire hardware and software upgrades and communications for implementing Army EC based on business process re-engineering and Army priorities that comply with the Secretary of Defense Directives outlined in the Defense Reform Initiative Report. Implementation will be in coordination with Army functional proponents, OSD, and the Defense Information Systems Agency (DISA). Acquisitions will include hardware and software to accommodate translating electronic output into formats consistant with Federal Information Processing Standard (FIPS) 161-2 for Electronic Data Interchange, as well as acquisition of other EC technologies that support the Army's transition to a paperless environment.

ARMY REUSE CENTER (ARC): ARC's mission is to ensure that DOD and Army objectives of reusable, maintainable, and reliable software assets and data models are achieved. This is accomplished through the development, implementation, maintenance, and administration of a total reuse program supporting the entire software development cycle. FY 99 funding expands communications, hardware, software, and communication lines to support the ARC's expanding Army user base. Emphasis will be placed on providing on-line access to Software Development Centers (SDCs), key support activities such as the Computer Science School, and selected PMs (e.g., SBA and RCAS). In addition to expanding the communication requirements, particular attention will be paid to expanding the user interface features such as expert systems and other Artificial Intelligence (AI) applications to assist the user in searching and analyzing the ARC's reusable components. In addition, this funding supports the ARC role in analyzing the Army C4I Technical Architecture and Reuse Technology Assessment effort for DISC4. This effort involves the analysis of twelve Army-wide domains to determine the degree in which each domain is consistent with the C4I technical architecture, including the potential reuse among Army components, development of an Army-wide implementation plan to provide for the systematic migration to the architecture, and execution of the plan in cooperation with DISC4 and various Army-wide components.

ARMY ENTERPRISE ARCHITECTURE (AEA): The AEA directly supports the necessity to address business process improvements, develop interoperable information resources, recommend protocols and standards for information technology and plan an interoperable C4I architecture as indentified in the National Defense Authorization Act for FY96. In addition the AEA works directly to establish the information framework to support the FY98-03 Defense Planning Guidance in development of a C4I Surveillance Reconnaissance (C4ISR) Architecture, The Army Plan, FY98-13 objectives and JCS Joint Vision 2010 to win the battlefield information war and dominate maneuver battle. FY 99 funds will provide the resources necessary for the on-going development of the AEA infrastructure and procure hardware, software, and modeling tools necessary to provide both the combat and the material development communities with integrated systems critical to the development of a shared data environment. These funds will target specifically the Systems and Operational Architecture production tools. The objective products include standard data and activity models, and Systems Architecture components for Joint and Echelons-above-Corps (EAC) operations and training. This infrastructure will substantially improve the Army's ability to produce and share dynamic models, based on doctrinally developed static representations of information exchange requirements. These tools are needed to continue the migration of materiel developers programs (weapons, C4I, and sustainment systems) to the DoD Common Operating Environment. The AEA infrastructure will maintain the Army's significant contribution to the DoD Data Standardization Program with an increased ability to share, reuse, and manage all data products within the Joint Community. Additionally, these funds will provide the tools necessary to develop the synthesis of a live with with a virtual environment which will be essential for the C4I community to capitalize on the latest modeling and simulation technology.

DESCRIPTION: This budget line provides for the purchase of automated data processing equipment (ADPE) for management information systems in the personnel community. The systems are part of the approved Personnel System Architecture and the Army's Modernization Plan.

JUSTIFICATION:

PERSONNEL ENTERPRISE SYSTEM-AUTOMATION (PES-A): PES-A is an ADP acquisition and redesign/implementation program which ensures that an adequate, modern, state-of-the-art automation infrastructure (automation training, computer platforms, services, telecommunications and productivity/automation tools) is available to support the War Fighter. The PES-A supports all five personnel functions, including recruiting, and is key to execution of day-to-day operations within the Army (e.g., strength accounting, personnel movement, assignment actions, career management, training, recruiting, reenlistment, and mobilization). It is the vehicle by which personnel are managed and information is provided to DOD, and ultimately, to Congress. The PES-A provides interoperability between key data processing installations of the Army's Personnel Community; the Total Army Personnel Command (PERSCOM), Army Reserve Personnel Center (ARPERCEN), Army Recruiting Command (USAREC), National Guard Personnel Center (NGPERCEN), and the Military Entrance Processing Command (MEPCOM), a joint command for which the Army is the executive agent. It fits into the Army Enterprise Strategy, supporting the modernization of Power Projection Platforms. It is fully compatible with and supports DOD's Enterprise Strategy/Corporate Information Management (CIM) initiative, and the Administration's Information Superhighway Initiative. FY 99 funds will buy automation infrastructure, communications capability, and system modeling to support the personnel community, with emphasis on system interoperability and Total Army Personnel Data Base permitting integration of Active, Reserve, Civilian, and Army National Guard Systems.

USMEPCOM JOINT COMPUTER CENTER (JCC): A memorandum of understanding between DOD and Selective Service System (SSS) formalized the establishment of the JCC where automatic data processing resources can be shared by USMEPCOM and SSS. The JCC mission includes the management and enhancement of shared resources, in full support of USMEPCOM and SSS peacetime and mobilization mission requirements. FY 99 funds will procure new technology tape drive storage systems and operating system software which support USMEPCOM and SSS peace time growth requirements.

(Continuation)

US MILITARY ACADEMY (USMA) IMA MODERNIZATION: The USMA is an accredited institution of higher learning. To maintain its accreditation standards and to instruct/prepare future Army Leaders to operate in the sophisticated high-tech world of modern warfare, it must employ in its classrooms/laboratories the latest technology/instructional tools available. Mini/microcomputers supporting the academic departments, must periodically be replaced as they become technologically obsolete or uneconomical to repair. FY 99 funding continues conversion of classrooms, upgrading classroom audio and video facilities. Additionally, funds will procure digital imaging and photography technology, USMA wide area network (WAN) upgrades, and expanded library software.

USMEPCOM INTEGRATED RESOURCE SYSTEM (MIRS): The purpose of US Military Entrance Processing Command (USMEPCOM) MIRS is to provide the automation and communication capability for USMEPCOM to meet its peacetime, mobilization and wartime military manpower accession mission for the Armed Services. The MIRS will be the cornerstone for a DoD-wide military accession system, Joint Recruiting Information Support System (JRISS), incorporating the concept of electronic data sharing using standard DoD data elements between USMEPCOM and all the Armed Services recruiting commands, greatly reducing redundant data entry. MIRS continues to improve Military Entrance Processing Stations (MEPS) operations by automating functions previously done manually. This project also includes Computerized Adaptive Testing-Armed Services Vocational Aplitude Battery (CAT-ASVAB), the automated version of the ASVAB test given to determine applicants mental abilities. Fy99 funding is critical to keep the current MIRS hardware running by buying memory and to support the additional DoD and service requirements as well as improve operations in the 65 Military Entrance Processing Stations (MEPS) throughout the United States. Fy 99 funding will also be used to start the process of determining replacement equipment for the current MIRS equipment which is rapidly becoming technologically obsolete and if not replaced in a timely fashion will be uneconomical to repair and will not be able to meet future DoD and service requirements.

DEFENSE CIVILIAN PERSONNEL DATA SYSTEM MODERNIZATION (DCPDS MOD): Army DCPDS MOD efforts will support the standardization of business processes in the Civilian Personnel functional area and regionalization of Civilian Personnel Offices. DCPDS MOD OPA expenditures provide automation infrastructure to support fielding of this DOD-wide system to Army activities receiving the DCPDS MOD capability. Automation infrastructure fielded to Army activities will consist of Open System Environment (OSE) compliant data and process servers, user workstations, system peripherals, communications infrastructure, and Commercial Off the Shelf (COTS) software, (operating system, DBMS, office automation, etc.) fielded to ten Army Regional Service Centers (RSCs) and more than 100 subordinate installation level Customer Support Units (CSUs). Army automation infrastructure will be compatible with the DOD DCPDS MOD application software and integrate with the OSE architecture at Army's sustaining base sites. Procurement strategy makes maximum use of existing contracts. This effort is projected to improve DOD wide productivity over 30% in the civilian personnel management functional area in order to accommodate reductions already applied to outyear Army Budget. FY 99 funds procure automation infrastructure to support the necessary productivity enhancements. The FY 99 infrastructure procurement completes initial Army DCPDS-MOD fieldings and provides necessary upgrades to support Air Force fielding in FY 99 of the objective DCPDS-MOD application software baseline to Army Sites.

JOINT RECRUITING INFORMATION SUPPORT SYSTEM (JRISS): The JRISS program has recently ceased to be a joint development effort. The program is being rescoped to emphasize Army recruiting requirements. Efforts will continue on deployment of this capability and implementation of Army specific recruiting automation enhancements which can be integrated with the Joint Defense Integrated Military Human Resources System (DIMHRS) when implemented. The rescoped program will support the standardization of business processes in the Army recruiting functional area and systems will be fielded to all levels of the Army recruiting structure. The rescoped program will aid the Army in its new accession goals in a era of steadily dwindling resources and shrinking pool of military service applicants. Key system features include standardized data, mobility for marketing, testing, data collections and reporting, one time data entry, automated leads distribution, and system generated reports. OPA expenditures provide automation infrastructure to support development of software for the Army system and for fielding to Army users. FY99 funds support initial acquisition of laptops for two Recruiting Brigades started in FY98. Funds will also procure system wide automation infrastructure, to include Local Area Networks (LANs), workstations, servers and printers.

DESCRIPTION: This budget line funds automation initiatives which support transportation, cargo movement, and resupply initiatives under the Army's Strategic Mobility Program (ASMP), begun in part as a result of lessons learned from Operation Desert Shield/Storm and the Congressionally mandated Mobility Requirements Study (MRS). The Army is changing its warfighting strategy from a forward deployed force to a CONUS-based force capable of rapid deployment worldwide. At the center of this strategy of rapid force movement are a number of transportation automated systems that facilitate/expedite force movement and resupply.

JUSTIFICATION: WORLDWIDE PORT SYSTEM (WPS): WPS is a Military Traffic Management Command (MTMC) automated information system (AIS) initiative essential to effective force projection and in transit visibility of unit and sustainment cargos. At the center of the new Army strategy for rapid power projection to meet unspecified threats, WPS is one of several systems that provide movement control support to the Army's Strategic Mobility Program, initiated as a result of lessons learned from Operation Desert Shield/Storm and the Congressionally mandated MRS. When fully fielded, WPS will support MTMC ocean terminals, US Navy port activities worldwide, FORSCOM Reserve Component Transportation Terminal Units, and Active Component Automated Cargo Documentation Detachments with worldwide warfighting support missions. Compact and transportable, WPS substantially increases the ability of the Defense Transportation System to provide in transit visibility information to the warfighting CINCs and USTRANSCOM, while reducing the personnel required to operate the system and the transportation required to deploy the system to remote places. WPS will replace four aging AISs that support ocean terminal management and cargo documentation missions during peace and war. The replaced AISs include the obsolete Terminal Management System in CONUS, and the Army Standard Port System - Enhanced, whose significant deficiencies were identified during Operation Desert Shield/Storm. FY 99 funds buy hardware and software to continue fielding WPS to selected sites.

AUTOMATED AIRLOAD PLANNING SYSTEM (AALPS): AALPS is a knowledge based "expert system" that assists user with aircraft planning. The Army originally developed AALPS as the Automated Air Load Planning System (AALPS) to provide a stand alone expert tool for Army load planning and deploying units. AALPS uses an artificial intelligence methodology to load plan for aircraft in near real time. The system takes data input of equipment and personnel, establishes gross load planning information, and quickly produces fully executable (certified) load plans for either a single mission, brigade sized deployment or multiple division sized airlift. AALPS is an approved migration system, and though it is a joint system, the Army is designated as the proponent, responsible for developing, implementing and fielding it to the services. FY 99 funds will be used to purchase hardware and software for Army users, supplying them with a deployable automated platform for developing load plans and manifests, which will be used in air deployments and in determining airlift requirements during contingency planning operations. Fielding sites are Ft Bragg, Ft Campbell, Ft Stewart, Ft Benning, Ft Drum, Ft Hood, Ft Lewis, USAREUR, Schofield Barracks, Ft Eustis, Ft Bilss, Ft Riley, Ft Sill, Ft Carson, Ft Richardson, Ft Polk, Ft Irwin, Ft Huachuca, Ft Lee, Ft McCoy, Ft McPherson, and Ft Dix.

DESCRIPTION: The Sustaining Base Information Services (SBIS) program consists of up to 13 custom developed applications to be fielded to various Army installations. SBIS applications are designed to operate in an Open Systems Environment (OSE) compliant automated infrastructure maximizing the number of support suppliers while minimizing the total life cycle cost. Funding provides for complete infrastructure solutions to support the applications developed under SBIS, and it procures SBIS servers which are integrated with existing automation assets at each fielded site. SBIS provides required automation support to improve and standardize critical sustaining base business processes. Fielded software has become an integral part of readiness, mobilization and installation management. Developed applications enhance key elements of those support missions and enable consistent, timely data collection and dissemination, allowing better management to key areas of the Army Safety Program, security clearance status monitoring, the schoolhouse system, and range facility management.

DESCRIPTION: The Joint Computer-Aided Acquisition and Logistics Support (JCALS) system provides an infrastructure capable of integrating digitized technical data that supports the weapons systems acquisition and logistics life cycle. The system is data driven and provides an automated information systems architecture, independent of application. JCALS will initially meet the Services' goal of automating technical manual processes and functions. The JCALS architecture provides a distributed, open systems environment that makes extensive use of both industry and Government standards. The architecture is designed for flexibility and growth, and is capable of accommodating additional system requirements, technological improvements and new functionality.

At the JCALS sites, hardware and software configurations are dependent on each site's organization and functions, processing needs and role in the overall system. The system provides local and wide area communications processing, distributes, manages, updates and replicates data throughout the system and delivers the applications and functions to the users' workstations. The system architecture includes a central site for user support, system monitoring, life cycle software support, maintenance and troubleshooting.

JUSTIFICATION: FY 99 funds support deployment of the JCALS capability to high priority technical manual users at 50 joint Service sites. The DOD approved site list is extensive, including service depots, installations and schools.

DESCRIPTION:

The Mortar Ballistic Computer (MBC) calculates ballistics trajectories and gives the mortar user data to elevate gun, set charge, and direct fire for all mortar rounds. The MBC uses state of the art technology to provide digital message capability and mortar firing computations. The MBC will interface with other command and control communication devices to improve required response time and first round accuracy for mortar fire. It incorporates ADA software and is operationally compatible with forward entry device. The hardware is a ruggedized hand held computer which weighs less than six pounds (8.9 Lbs with case, carrying straps and 72-hour batteries).

JUSTIFICATION:

The current M23 MBC is not supportable in the field due to repair and components no longer being available/procureable. Also, the memory capacity of the current M23 MBC does not support projected mortar ammunition items in inventory. The improved MBC will be capable of accepting software upgrades electronically, thus reducing the time and cost currently required to apply software upgrades via a hardware change to each fielded unit. The FY2000 program funds a pre-planned product improvement to bring the M30 into compliance with the Army Technical Architecture (ATA) standard.

DESCRIPTION: The Army Data Distribution System (ADDS) is a Command, Control, and Communication (C3I) network consisting of the Data Radios Systems: Enhanced Position Location Reporting System (EPLRS) and Near Term Digital Radio (NTDR). EPLRS is a direct outgrowth of the Army/United States Marine Corps (USMC) Position Locating Reporting System (PLRS) and provides battlefield commanders combat information on the position of their forces in addition to supporting the majority of the data communication needs of the multitude of computers to be fielded as part of the Army Tactical Command and Control System (ATCCS) and battlefield digitization efforts. EPLRS is the primary data communications means in the division and corps until the FY04 time frame. The Wide Band Data Radio provides greater data transmission capability, is upgraded via software and is consistent with the evolving PMCS reference model architecture. The Army is fielding ATCCS to automate and increase the effectiveness of the five Battlefield Functional Areas (BFA): Maneuver Control, Fire Support, Air Defense, Intelligence, and Combat Support. ADDS is essential to support tactical operations on the automated battlefield with reliable, real-time, secure, jam resistant data communications and position location capabilities. It has been designed specifically to meet the data communication requirements of emerging computer and sensor systems.

JUSTIFICATION:

EPLRS: The FY99 budget will allow the Army to procure 201 additional Enhanced PLRS User Unit (EPUU) Radio Sets (RSs) and continue the fielding of prior year hardware procurements to contingency Corps units. The FY99 budget will also provide for New Equipment Training (NET), integration, ECOs, life cycle software engineering and program management support.

DESCRIPTION: The Mobile Subsc	riber Equipmen	it (MSE) Cor	nmunication	s System is	a fielded area	a switching ar	nd radio con	nmunication	system prov	iding Corps :	and Division,	mobile

The Mobile Subscriber Equipment (MSE) Communications System is a fielded area switching and radio communication system providing Corps and Division, mobile and wire-line users automatic secure dial telephone service for both voice and data. MSE provides uninterrupted communication which enables commanders and staffs to exercise command and control from both mobile platforms and Command Posts which may be dispersed or massed, and requires frequent relocation due to enemy threat and conduct of battle.

JUSTIFICATION:

The Echelons Corps and Below (ECB) portion of the Area Common User Systems - Modernization Plan (ACUS-MP) has been moved to the Joint Tactical Area Comms Sys line SSN BA1010 FY 98 and beyond.

DESCRIPTION:

The Single Channel Ground and Airborne Radio System (SINCGARS) is the VHF-FM Radio Communications System providing the primary means of command and control for infantry, armor, artillery, and Army aviation units. It possesses capabilities and improvements over the 1960 technology radios it replaces in manpack, vehicular, and airborne configurations. Its Frequency-Hopping jam resistant capability will offset the current threat of jamming techniques used against the existing family of fixed frequency radios. SINCGARS continues its evolutionary development with the fielding of the SINCGARS System Improvement Program (SIP) radio. The SINCGARS SIP radio provides for enhanced data and voice communications while using commercial Internet Protocols within an Internet Controller. The SINCGARS SIP radio forms the linchpin of the Tactical Internet and is a major contributor to the Army digitization effort. It will assist commanders in conducting the battle on the digitized battlefield. SINCGARS is used in such systems as PATRIOT, M1A2 Tank Improvrement Program, Paladin, and Longbow Apache.

JUSTIFICATION:

Funding in FY 99 and out will support completion of the fielding program.

REMARKS:

CHS Workstation Upgrade did not include transit cases, mountings and ancillary items as they were not available/negotiated. They will be purchased in FY 98 under line BA 1201. The cost for these items is not included in the unit price.

Accelerated delivery of Data Transfer Devices was provided by Allied Signal in order to meet backlog orders to support FY 97 fielding schedule.

DESCRIPTION: The Global Command and Control System-Army (GCCS-A) will provide the Army's interface to Joint Staff Global Command and Control System (GCCS) program. GCCS-A is being implemented in accordance with the GCCS concept of Defense Information Infrastructure Common Operating Environment (DII COE) and the Army Battle Command System (ABCS) Operational Requirements Document (ORD). The GCCS-A is the integration of software, hardware and communication architecture supporting strategic and tactical environments. The software development requirements for GCCS-A will be satisfied through a single systems engineering and integration contract which was awarded in December 1994. The intent is to field an integrated command and control (C2) system that provides standard, modular, system support and application software support capable of supporting a "tailored" set of functional applications and compatible, integrated exchange of data both horizontally and vertically throughout the Army hierarchy. This will accommodate a flexible, interoperable C2 system that can be tailored for various levels of command and will ensure connectivity. GCCS-A will support operations during peace as well as war including contingency and natural disaster operations. It will support major Army commands (MACOMS), Army Commanders in Chiefs (CINCs), Army Commands and Components, and Army elements within the Pentagon. The GCCS-A will support all staff sections within a headquarters, and all phases of conflict.

JUSTIFICATION: FY 99 funds will support the procurement and fielding of GCCS-A at all Army-managed worldwide command and control sites. Fielding of GCCS-A is mandatory in order for the Army to remain in lock step with GCCS milestones, and support the Army Battle Command System. Funds also support the DCSOPS, DISC4, and the TRADOC System Manager (TSM) directed establishment of Regional Training Centers (RTCs) in FY 99.

Wpn Sys Proc U/C												

Effective FY98, BA1010 funds 2 separate allotments in accordance with (IAW) transfer of PM JTACS equipments to US Army Communications Electronics Command (CECOM), as follows: (1) Funding for Project Manager, Warfighter Information Network-Terrestrial (PM WIN-T) to support personnel/equipments negotiated to remain with the new PM; the WIN is a total information system architecture that supports requirements of the Digitized Force XXI. WIN is the architecture that will seamlessly link our diverse information resources into a network Army warfighters can use on the 21st century's digitized battlefield and (2) Funding for CECOM Special Project Office, JTACS Systems Branch, and completion of Level II projects.

REMARKS:

The Echelons Corps and Below (ECB) portion of the ACUS-MP (SSN BB1610) has been moved to this line effective FY98.

Quantity/Unit Cost not applicable for ACUS-MP and Downsize Programs. Systems are being procured as software enhancements/engineering change proposals/non-recurring engineering efforts and studies.

QEAM award in FY 97 is for engineering change proposals to correct deficiencies found during user test and Task Force XXI . FY98/99 supports contractual efforts for ECPs, training videos and warranty revision program.

DESCRIPTION:

The ACUS MOD PROGRAM (WIN-T) line funds the ongoing and planned modifications to the Area Common User System (ACUS) and supports its migration to the Army's Warfighter Information Network (WIN) systems architecture. The WIN is a total information system architecture that supports the requirements of the Digitized Force XXI. WIN is the architecture that will seamlessly link our diverse information resources into a network the Army warfighters can use on the 21st century's digitized battlefield. The components of the terrestrial portion of WIN are; (A) The Division Slice is the engineering effort to prove out the institutional upgrade of the legacy area common user system switches with Asynchronous Transfer Mode (ATM); (B) The Switch Modernization procures/fields upgraded capability throughout the Army; (C) The Radio Modernization provides the increased transmission pipes between switches to move voice, data, video, collaborative planning, etc. on the digitized battlefield; (D) Battlefield Video Telephoneconferencing (BVTC) provides a single standard video terminal on the battlefield; (E) Remote Access Unit Range Extension increases the range a minimum of 50% for the current mobile telephone, and (F) Tactical Internet Manager provides Wide Area Network management and services for the brigade and below portion of the tactical internet. Also included are spares to support all upgrades and associated upgrades to the Training Devices. The objective is for a Force Package (FP) and corresponding slice of Force Support Package (FSP) to be fielded every 3 years after the First Digitized Division (FDD) in FY 00 and First Digitized Corps (FDC) in FY 04. This line also supports ACUS Legacy Systems, such as: DGM Antenna Mast Program (DAMP): AN/TSM-210 Maintenance Shelter; Downsized Communications System Control Element (D/S CSCE).

DESCRIPTION: The SHORTSTOP Electronic Protection System (SEPS) is a fully integrated Radio Frequency Countermeasure system which is designed to provide protection for personnel and high value assets against proximity fuzes. There are three configurations of the SHORTSTOP Electronic Protection System: a manpack system, a stand alone system, and a vehicle mounted system. SHORTSTOP will maximize tactical utility and provide protection against indirect fire. SHORTSTOP will be used by Infantry, Engineering, Armor, Field Artillery and Intelligence units to enhance survivability.

JUSTIFICATION: FY97/98 funding is a result of a Congressional plus-up to support an Urgent Requirement to provide SHORTSTOP vehicle mounted systems to Korea.

This line is required to fund the fielding costs associated with a variety of Communications-Electronics (C-E) systems and efforts not identifiable to a current major system hardware line. Fielding costs include Total Package Fielding (TPF), New Equipment Training (NET), and First Destination Transportation (FDT). TPF efforts include validation of the Materiel Requirements List (MRL), depot staging costs, deprocessing, inventory, installation and handoff of all required equipment and materiel to gaining units. The funding shown for NET is to train the instructor and key personnel who then train the users in the field in operating and maintenance of CECOM managed equipment. FDT costs are those associated with the shipping of various C-E equipment from the contractor to the depot.

JUSTIFICATION

The primary efforts to be funded in FY99 are TPF/NET for C-E equipment requirements for the conversion of selected units. Funds will activate multiple brigades with MSE and TRI-TAC capabilities. These conversions are restructured in accordance with (IAW) a downsized force structure. The primary projected efforts to occur in FY99 are the conversions of the 534th Sig Bn and 156 Sig Bn to MSE equipment and the conversion of MSE shelters from Digital Group Multiplexers (DGM) to the newer Transmission Interface Module (TIM) system MSE. These funds will ensure that critical round-out signal units are equipped for the mobile digitized battlefield with GO-TO-WAR systems.

DESCRIPTION: The Soldier Enhancement Program procures soldier items that will ensure that our combat soldiers maintain and improve their lethality, survivability, mobility, command and control, and sustainment. Commencing in FY98, the item to be procured will be the Soldier Intercom (SI) [formerly identified as the Individual Soldier Radio (ISR)]. The SI is a small voice radio with a tethered speaker/microphone for use by individuals within a squad to coordinate their movement. SI will allow squad members to communicate more effectively while conducting day/night combat operations over distances without relying on hand and arm signals, particularly in Military Operations in Urban Terrain (MOUT). The SI is an inexpensive means of coordinating squad communication and facilitates dissemination of information from the squad leader. The SI consists of a receiver/transmitter, antenna, speaker/microphone, and carrying case for the load bearing equipment. The SI is the US Army Infantry Center #1 materiel solution priority.

JUSTIFICATION: Command and control through radios currently ends at the squad leader level. The SI will extend the ability of the squad leader to disseminate voice information to the members of the squad by using a small rugged, non-developmental radio. The FY99 funds will complete fielding of Force Package (FP) I and commence fielding of FP II and III (i.e., non Land Warrior, Mounted Warrior, and Air Warrior).

DESCRIPTION:

IMETS is a mobile tactical automated weather data receiving, processing, and dissemination system designed to provide timely weather and environmental effects forecasts, observations, and decision aid support to the Army. The IMETS is an Army-Furnished system consisting of a standard shelter and vehicle, Army Tactical Command and Control System (ATCCS) common hardware/software (CHS), and communications that will be operated by Air Force weather personnel and maintained within planned Army support for systems and components IAW AR 115-10/AFR 105-3. IMETS is deployed at Echelons Above Corps (EAC), Corps, Division (DIV), Separate Brigade, Armored Cavalry Regiment (ACR) and Special Operations Forces (SOF). Standard Integrated Command Post Shelters (SICPS) mounted on High Mobility Multi-Purpose Wheeled Vehicles (HMMWV) (heavy) house the IMETS. Each IMETS is configured identically and is capable of performing the following functions: (1) receive weather data from all available sources: weather satellites; local and remote weather sensors at higher, lower and adjacent echelon IMETS; weather radar; artillery meteorology sections (ARTYMET); theater forecast units (TFUs) and USAF Global Weather Central; (2) process and display weather information, display weather radar data, display weather satellite data and imagery, and generate Tactical Decision Aids; (3) disseminate weather data, forecasts, and Tactical Decision Aids via area communications system, to all users and to other IMETS at higher, lower and adjacent echelons; (4) operate independently using High Frequency receivers, satellites, or communications networks as appropriate; and (5) relocate with the unit to which it is assigned.

JUSTIFICATION:

FY99 funding supports the procurement and fielding of the five Block II IMETS to Force Package 1 & 2 units. IMETS is the first link in providing the most accurate and current weather information and weather effects, therefore supporting the concept of a near all weather operational capability.

DESCRIPTION:												

DESCRIPTION:

The USAF Combat Survivor Evader Locator (CSEL) communication system handheld radio includes secure digital message communications, Global Positioning System (GPS), line of sight (LOS) voice, and radio satellite and ground equipment interfaces to work with existing search and rescue systems for downed aircraft personnel. CSEL decreases the enemy's ability to detect or decipher rescue communications through the use of satellite communications. GPS allows pinpoint location of the U.S. survivor evader. Based on replacing the AN/PRC-112, there is a requirement for 18,531 CSELS, including Special Forces. JUSTIFICATION:

The FY 99 program of 1890 units are to support Force Package 1.

DESCRIPTION: Army Tactical Operations Centers (TOCs) are the automated facilities where commanders will plan, control, maintain situational awareness, and execute battle command. For the Digitized Army, TOCs will incorporate Army Battle Command Systems (ABCS), five Army Tactical Command and Control Systems (ATCCS) systems, and Force XXI Battle Command - Brigade and Below (FBCB2)) providing the framework for the digitized battlefield, fully integrate and digitally link Battlefield Operating Systems (BOSs); and meet the requirements mandated by the Army Technical Architecture (ATA) and the Defense Information Infrastructure (DII) Common Operating Environment (COE). A standard/common TOC operational architecture and system architecture tailored to the echelon of command and mission area will be developed to assure interoperability and commonality.

JUSTIFICATION: The Army TOC Program will provide centrally funded TOCs for the First Digitized Corps and support warfighting customer initiatives. Army TOCs will ensure the objectives of standardization and interoperability across forces by developing and fielding operationally effective and supportable integrated, digitized tactical operational centers that satisfy the functional information requirements of commanders and staffs at all echelons of command. FY99 funds will procure integration hardware, integration services, and fielding to upgrade and refurbish 23 DIV XXI TOCs and 15 new TOCs. Army TOCs are the C2 nodes which will, for the first time, provide a digital information based operation to plan, control, and dynamically update in real time as the situation evolves/changes. The Army TOC Program is critical to the success of Army Digitization Modernization and to provide warfighters with the tools to win the information war.

AFATDS is a single integrated battlefield management and decision support system. It will function on the digital battlefield at Battery through Echelons Above Corps as one of the five battlefield automated systems of the Army Battlefield Command and Control Systems (ABCS). AFATDS utilizes evolving technology of the ABCS Common Hardware/Software procurement. AFATDS is designed to overcome the size, vulnerability, high sustainment cost, limited functionality, central processing and training limitations of the present artillery battalion, division and corps fire direction systems. AFATDS will take advantage of advancing software technology, graphics, decision aids and embedded training to expand the Fire Support functions. AFATDS will be the Fire Support node of the ABCS utilizing the Army Common Operating Environment architecture and providing software assistance to the Fire Support elements and interfacing with all subsystems subordinate to AFATDS and other nodes of the ABCS via standard communications media available to the force. AFATDS will provide all 27 Fire Support functions. These 27 functions are grouped into five Fire Support operational needs: Fire Support Execution, Fire Support Planning, Movement Control, Field Artillery Mission Planning, and Field Artillery Fire Direction Operations.

AFATDS hardware items are composed of the following: Fire Support Control Terminal (FSCT), Lightweight Computer Unit (LCU), Tactical Communications Interface Module (TCIM), printers, Tactical Display Devices, and interface kits. This will all be ABCS Common Hardware. Responsiveness, survivability and continuity of operations will be enhanced via dispersed processing centers, intelligent remote terminals, a distributed data base management system and distributed operations. AFATDS will interface with all functional control elements of existing and future Army Fire Support Systems, including the other ABCS Battlefield Functional Area systems, other services employing Fire Support Joint Interoperability message standards and Allied Forces using NATO Fire Support Standards.

Justification: AFATDS will greatly enhance the fire support capability of the battlefield through responsiveness, survivability and continuity of operations. It will provide a complete fire control command and control capability to the commander. FY99 will procure 2 Heavy Divisions, 1 Armored Cavalry Regiment, Training Base hardware and backfill requirements for Forward Observer. FIST. and COLT units upon availability of the Forward Observer Software (FOS).

REMARKS:

FSCT, Ultrasparc Computer Unit (UCU), and LCU are commercial level off- the -shelf hardware being procured on the Common Hardware Software (CHS) contract. IKs reflect total cost for Command Vehicles and FIST Installation Kits.

FSCT unit cost reflects varying requirements for peripheral components.

DESCRIPTION:

The Fire Support Ada conversion (FSAC) is composed of two software programs to provide Command and Control at corps through platoon level for Multiple Launch Rocket System (MLRS) units, and for tactical fire control for cannon units at platoon and battery levels. FSAC fieldings were completed in May 96 and it is not intended to fund this line past FY 98. The FSAC program funding in FY 97 and 98 provides for Package 11 Upgrades, maintenance of equipment, and funding conversions on an individual basis. Package 11 requires existing LCUs have upgraded Hard Disk Drives to support the modified software as directed by ODCSOPS.

On 21 April 1995 ODCSOPS further directed PM FATDS to initiate the Lightweight Forward Entry Device (LFED) program with the FSAC funding line. The LFED is a hand-held programmable input/output unit used for composing, editing, transmitting, receiving and displaying alphanumeric and graphic messages for transmission over standard military radios.

JUSTIFICATION: There is no funding in FY99 $\,$

DESCRIPTION: Combat Service Support Control System (CSSCS) is an automated command and control (C2) system supporting the CSS component of the Army Battle Command System (ABCS), providing the commander a critical logistical C2 capability for the Army's Force XXI. The CSSCS will rapidly collect, analyze and disseminate CSS information to support the functions of command, control and resource management. CSS commanders and staffs are currently participating in the force level planning and decision-making process through a manual effort of gathering correlating, and analyzing volumes of technical data from the existing Standard Army Management Information Systems (STAMIS). CSSCS will provide timely situational awareness and force projection to determine capability to sustain current operations and support future operations. CSSCS uses evolving commercial computer technology of the Common Hardware/Software (CHS), and software built within a Common Operating Environment (COE). CSSCS will be deployed at echelons above corps, corps, divisions, maneuver brigades, separate brigades and armored cavalry regiments. The total OPA requirement for CSSCS is 1,651 systems.

JUSTIFICATION: FY99 funds will support the procurement and fielding of the CSSCS in Full Scale Production. Fielding locations include the XVIII Airborne Corps, 101st Air Assault Division, 3rd Infantry Division, and the training base. This automated CSSCS node is required to support the fielding and operation of ABCS by providing a responsive automated CSS operation that is capable of supporting the Commander's requirement to perform timely prediction and situation analyses.

DESCRIPTION: This budget line consolidates funding for improvement/modernization of Information Systems worldwide. It encompasses nontactical telecommunications services in support of Army base operations and Information Systems for Command and Control (C2) requirements. Also, it funds acquisition of common user information systems in support of Military Construction, Army (MCA) projects.

JUSTIFICATION: The Information Systems (CONUS/Western Hemisphere) program finances upgrades to the Army's telecommunication infrastructure. It includes the MACOM telephone Modernization Program (MTMP), an integral part of the Power Projection Command Control Communication Computer Infrastructure (P2C4I) initiative which supports the communications requirements of deployed forces and their access to home installation sustaining base systems. The Information Systems (CONUS/Western Hemisphere) program also finances information infrastructure investments and modernization to support the National Guard portion of the Army Distance Learning Program. The MTMP supports replacement of aging electromechanical switches with electronic digital switches to implement the Integrated Services Digital Network (ISDN) concept and insures compatibility with public networks. The Information Systems - MCA Support program finances acquisition of information systems equipment and switch expansion equipment to be installed in conjunction with military construction projects worldwide, which are not included in the MCA funding. The Information Systems - EUCOM program finances the procurement of hardware and software to replace aging communications equipment in an effort to streamline operations and maintenance costs, improve productivity and customer service, and reduce circuit costs in Europe. The Information Systems - PACOM program continues the transition to the ISDN for the Pacific Theater, which will provide intra-base information transfer capability and common data transmission in the place of costly individual stovepipe and non-standard networks.

DESCRIPTION: This budget line includes efforts in support of the MACOM Telephone Modernization Program (MTMP) and the European Telephone Switch (ETS) upgrades. MTMP is an integral part of the Power Projection Command, Control, Communications and Computers Initiative (PPC4I). The overall objective of PPC4I is to: (1) support communication requirements of deployed forces and their access to home installation sustaining base systems; and (2) to emplace Information Systems in a coordinated, synchronized, integrated manner, thereby optimizing funding/personnel resources and maximizing the operational benefits. PPC4I identifies the cooperative role and responsibility for installations in the active, direct execution of the National Military Strategy to project forces beyond the borders of the United States to anywhere in the world with little advance notice. The MTMP started in FY 83 to replace the old Dial Central Offices with state-of-the-art digital switches at CONUS Army installations. Upgrading telecommunications equipment insures the most effective interface with existing public telecommunications networks and optimizes the development of evolving Department of the Army programs. MTMP is also assigned with the implementation of the Integrated Services Digital Network (ISDN) within the Army, thus supporting the most efficient utilization of bandwidth.

The ETS network replacements in support of USCINCEUR and USAREUR switching requirements, as documented in CINCEUR letter dated 9 Oct 97 and USAREUR letter dated 20 Oct 97, supports the replacement of existing Army Siemens KNS-4100 switches with state-of-the-art switches as part of the overall DISN-EUR switch replacement program.

JUSTIFICATION: FY99 funds will provide upgrades for 29 each SL-100 MTMP switches with the MSL-07 versions software and new processors, making them Year 2K compliant. The replacement of the European switches is mandatory as stated by USCINCEUR in a memorandum to the Chairman of the Joint Chiefs of Staff of the Army. The requirement is to continue to provide telephone services to the warfighters in the European theater and provide connectivity to the Sustaining Base in CONUS. The existing switches will be unsupportable by Dec 2004 and repairing and maintaining these antiquated switches is not cost effective. The existing switches

DESCRIPTION: The European Telephone Switch (ETS) network switch replacements in support of USCINCEUR and USAREUR switching requirements, as documented in CINCEUR letter dated 9 Oct 97 and USAREUR letter dated 20 Oct 97, supports the replacement of existing Army Siemens KNS-4100 switches with state-of-the-art switches as part of the overall DISN-EUR switch replacement program.

JUSTIFICATION: The replacement of the ETS switches is mandatory as stated by USCINCEUR in a memorandum to the Chairman of the Joint Chiefs of Staff and USAREUR in a memorandum to the Chief of Staff of the Army. The requirement is to continue to provide telephone services to the warfighters in the European theater and provide connectivity to the Sustaining Base in CONUS. The existing ETS switches will be unsupportable by Dec 2004. The existing ETS does not meet mission requirements today. If replacement switches are not installed by that time, there will be no reliable telephone service to the warfighter in garrison and there will be no access available to the worldwide Defense Information System Network (DISN) for warfighters deployed in the field. FY-99 funds will procure the replacement of switches in Europe.

DESCRIPTION: I	Information Syst	tams (PACC	M) encomp	acces non-t	actical telecor	nmunication	c requiremen	te to euppor	Army baca	operations a	nd II S Milita	n''

DESCRIPTION: Information Systems (PACOM) encompasses non-tactical telecommunications requirements to support Army base operations and U.S. Military Command and Control (C2) requirements in the Pacific theater, including upgrade of fixed plant telephone systems in Korea and Japan. The upgrades of the Korea Telephone Network (KTN) and Japan Telephone Network (JTN) will modernize the Army telephone systems in the respective countries. The switch hardware and software will be upgraded to provide integrated voice and data capabilities, as well as to provide the added line capacity required to satisfy critical Korean warfighter missions.

JUSTIFICATION: The FY 99 funds will procure software and hardware upgrades at all host switches in Korea and Japan networks. These sites are the top priority of the Eighth U.S. Army and U.S. Army Japan. The upgrades will provide voice, data, and video services over a single Integrated Services Digital Network (ISDN) connection. Additionally, the upgraded switches will operate more efficiently, providing a cost avoidance for the Department of Defense.

DESCRIPTION: The program provides state-of-the-art major information system equipment such as integrated voice/data switches; Tier II computers (i.e., common user, multiple-purpose assets supporting Army installations and/or organizations); voice/data switch expansions; common user LAN transport equipment; and basic telephone instruments. This equipment is to be installed in conjunction with Military Construction, Army (MCA) projects. Included in this program are funds for the renovation of the facility housing the War College at Fort McNair. The Army is executive agent for the National Defense University (NDU), which is renovating Building 60 at Fort McNair, to correct longstanding over-crowding and failing/antiquated mechanical systems. Classrooms are 1960's vintage or older and cannot accommodate modern electronic systems without major improvements to the building's infrastructure. The OPA funded information systems are critical to NDU's ability to comply with academic standards, improve the quality and professionalism of instructional systems, meet Congressional mandates for increased faculty/student ratio, and support growing student loads.

JUSTIFICATION: FY 99 funds support information systems requirements associated with approved MCA projects. Funding is applied to specific projects based upon mission priority, timing of construction schedules, beneficial occupancy dates (BOD), and minimum lead time required for acquisition and installation of associated information system equipment. FY 99 funding provides \$4.7M for the upgrade, installation and testing of an SL 100 Telephone switch for MCA project #26803 in Qatar in addition to other information systems requirements. Funding supports regulatory requirements as outlined in AR 415-15 and other applicable U.S. Army Directives. These funds are essential to insure that information systems are installed in sync with Corps of Engineer construction schedules. FY 99 funding supports thirty-five (35) approved MCA projects.

DESCRIPTION: The Forward Area Air Defense Command and Control (FAAD C2) System is an automated system deployed with FAAD weapons to provide accurate and timely command, control, and targeting information for weapon systems. The system utilizes non-developmental item sensors (Light and Special Division Interim Sensor and/or Sentinel (Ground Based Sensor)), computers, displays, and interface hardware integrated with data communication equipment. It automates mission-related functions and uses the Single Channel Ground and Airborne Radio Systems (SINCGARS) for voice and the Army Data Distribution System (ADDS) for data. Limited production of the system was authorized in May 1993 and the first unit equipped was the 101st Airborne Divisions (Air Assault) in September 1993. Since this fielding occurred prior to the availability of the Enhanced Position Location Reporting System (EPLRS) portion of ADDS, additional SINCGARS radios were added to transmit data. On 1 March 1995, this program was designated an Acquisition Category 1C (ACAT 1C) from ACAT 1D by the Undersecretary of Defense for Acquisition and Technology. In April 1995 full scale production was approved and type classification was granted by the Army Acquisition Executive contingent on the Joint Requirements Oversight Council approval of the Operational Requirements Document; the approval was granted in June 1995.

JUSTIFICATION: FY 1997-FY 1999 dollars will be used to procure Common Hardware Software (CHS) computers, displays. software, and Joint Tactical Information Distribution Systems (JTIDS) to field heavy divisions and remaining units. FAAD C2 enables maneuver commanders to receive air attack warnings from Corps, Division, Brigade, and Battalion to the individual shooter. FAAD C2 also enables the alerting of air defense gunners, enhances capability for air space management, and automated uptell of acknowledgment of mission and unit position, ultimately enhancing protection to the Force.

^{* 2} additional prior years units procured during development for a total of 30 units (database should show 28 total).

^{**} Does not include all SAR data; SAR includes FAADC2 and Sentinel (Ground Based Sensor)

DESCRIPTION:

The FED is an integral part of the digitized fire support system architecture. The FED provides the vital sensor to shooter link required for effective fires. The FED also provides critical situation awareness for forward deployed field artillery units.

The Forward Entry Device (FED) program provides the hardware platform to support DoD mandated interoperability/Army digitization requirements (to include implementation of the MIL STD 188-220A protocol and Variable Message Format), to support the new functional user requirements under the next software release and Joint technicial architecture-Army (JTA-A). FED is used in the Heavy Divisions by the Forward Observer (FO), Field Artillery (FA) Battery Commanders and Fire Support Team (FIST) personnel.

The FED will utilize the same hardware as the Lightweight Forward Entry Device (LFED). FED replacement ensures continued Heavy Division Digital Communications utilizing the Forward Operating System (FOS) software. Without the FED only manual voice call-for-fire misions will be possible.

JUSTIFICATION: In FY99 we are buying 852 units which will complete the 1st Digitized Division.

* FY99 Unit cost increase is due to the retrofit of the previous boxes, increased RAM, an upgrade to a Pentium Plus and the requirement for a printer and IK in these units.													
** FY97 management support for this program was funded out of the FSAC line (B78400)													
*** The increase in Engineering Support in FY99 is due to the requirement to test and incorporate voice recognition into the software and the HTU boxes.

DESCRIPTION: The LaserStrike (Striker) program integrates the Bradley Fire Support Vehicle (BFIST) mission equipment package (MEP) into a HMMWV chassis supporting heavy and light force fire support operations. The LaserStrike program is a continuation of the BFIST program designed specifically for the Combat Observation Lasing Team (COLT) in heavy divisions and light divisions. The LaserStrike was approved as a Warfighting Rapid Acquisition Program (WRAP) designed to get the LaserStrike operational enhancement to the soldier quickly at the best cost.

JUSTIFICATION: The LaserStrike program modifies components of existing systems and leverages acquisition resources already dedicated for the BFIST program. The LaserStrike program will also leverage test and development activities, along with providing for Horizontal Contract Integration (HCI) across platforms. The LaserStrike provides for integration of the BFIST MEP as a bolt on kit. This strategy will reduce costs and acquisition time, while also affording greater adaptability of the LaserStrike kit to common wheeled platforms.

(U) DESCRIPTION: The All Source Analysis System (ASAS) provides US Army commanders at echelons above corps through battalion a standard all source intelligence processing/reporting system and provides commanders the means for gaining a timely and comprehensive understanding of Opposing Force (OPFOR) deployments, capabilities, and potential courses of action. The system interfaces with selected national, joint, and theater Intelligence assets, adjacent/higher/lower military intelligence processors and sensors, Army Battle Command System (ABCS), and organic deployed Intelligence/Electronic Warfare (IEW) teams and assets. The ASAS also is a user of terrain and weather data. The ASAS system uses standard joint and Army protocols and message formats to interface with forward deployed sensors/teams, intelligence processors and joint/national/Army C3I systems.

In March 1994, the Vice Chief of Staff, Army directed that an accelerated fielding of the ASAS capability across the force (including all Army Military Intelligence units and National Guard Enhanced Readiness Brigades) be accomplished by FY99. This accelerated fielding, called ASAS-Extended, is being accomplished by issuing ASAS software operating on Non-Developmental Item (NDI) commercial off-the-shelf (COTS) Common Hardware/ Software (CHS-2) to provide an ASAS capability to units not receiving the 12 previously procured ASAS Block I. ASAS-Extended is based on a modular approach which allows for incremental enhancements of ASAS capabilities using the fielded ASAS baseline and by leveraging the traditional acquisition successes of ASAS Block I.

(U) JUSTIFICATION: FY 99 funding is required to replace selected aging Block I workstations with CHS-2 workstations and enhanced software; support digitization; and complete procurement and fielding of the last 4 ASAS-Extended unit sets. FY99 funding will also be used to fix the Year 2000 (Y2K) problem in the ASAS Communication Control Set and Compartmented ASAS Message Processing System.

DESCRIPTION: This budget modernizes and integrates the digital communication operations within the Pacific and European Theaters. The architecture of the Defense Information Infrastructure (DII) will be reconfigured to accommodate the rapidly changing deployment and realignment of forces within the Pacific and European Theaters. This program is a component of the Army's seamless Enterprise Network that provides compatibility across operational systems. The modernization program supports force projection through technology insertion and evolutionary changes. The program will utilize emerging technological developments to capitalize on digital information systems throughout the worldwide DII. The theater Combatant Commanders require a robust infrastructure that will facilitate mobilization and sustainment of a deployed force.

The US Forces, Korea (USFK) requirements have been approved in the Extended Korea Improvement Program (EKIP) and the Korea Communications Infrastructure Upgrade (KCIU) by the Joint Chiefs of Staff (JCS). The EKIP and KCIU are JCS directed programs to strategically improve the ability to successfully defend Korea during periods of stress, increase survivability of C4I systems for the warfighter, increase information systems capacity to meet surge requirements, and improve the ability to reconstitute C4I systems. These programs also support command and control communications networks serving the Commander-in-Chief, US Forces and United Nations Command, Korea, and Commander-in-Chief, US Forces, Japan. The modernization of communications systems is essential for wartime capabilities in the Pacific staging areas of Korea and Japan.

Description: Life Cycle Software Engineering (LSCE)support, by the Software Engineering Center, provides the essential services needed to maintain CECOM managed fielded Battlefield Automated Systems(BAS)in a state of operational readiness. The Mobile Subscriber Equipment, Maneuver Control Systems, Firefinder, TRITAC Switches, and Intelligence/Electronic Warfare Systems are some of the 221 BASs supported by the SEC that directly depend on LCSE support to maintain a posture of mission critical readiness. Adequate funding for LCSE support is essential for the acquisition, operation, maintenance and sustainment of multihost computer systems, peripherals, interfaces, support equipment, test beds, components, and software used to provide the necessary services and support to maintain BASs in a state of operational readiness.

Justification: Policy for PPSS requires that system managers provide initial host capabilities for new systems, and that the Life Cycle Software Engineering Centers (LCSEC) provide upgrades and replacement of obsolete equipment. Significant portions of host and network equipment are five years old or older and/or reaching obsolescence. There is the requirement to respond to emergency requests from the field for Software Engineering support in order to maintain operational readiness of deployed BASs. With host computers, peripherals (e.g., memory storage devices, terminals, keyboards, and printers, media and replication equipment) having a life-span of approximately five years and the SEC performing its mission over a continuous period of time beyond five years, equipment must be replaced and/or upgraded regularly to deal with obsolescence and to take advantage of the continual improvements in technology that are indigenous to high-technology based weapon systems and their software support environments, in order to meet the ever increasing mission requirements imposed by the field. Funding for this task is essential to provide and maintain the software support environments and LCSE support required to maintain fielded BASs in a state of operational readiness, worldwide, to support the Soldier in the field.

DESCRIPTION: LOGTECH or Automatic Identification Technology (AIT) provides state-of-the-art technologies that offer rapid and accurate data capture, retrieval and transmission. The technology includes various radio frequency barcode scanning devices, barcode label and page printers, and various data carrier devices with associated readers and writers. The data carrier devices include optical laser cards, integrated circuit chip cards (smart cards) and PC memory cards. AIT devices are used with automated logistics systems to facilitate and expedite property receiving, distribution, storage, inventory management and accountability. AIT is used throughout the Army at the wholesale (AMC) and retail (STAMIS) supply levels and in automated maintenance, personnel and transportation systems, where rapid and accurate source data collection is required. The AIT contract establishes a baseline of AIT devices for use throughout DoD and ensures standardization and interoperability of this equipment among the Services.

JUSTIFICATION: FY99 fieldings support Depot Systems Command, Major Commands and Army STAMIS with AIT and Radio Frequency Portable Data Collection Device (RFPDCD) Networks and printers. Funds will continue these essential initiatives, satisfying logistics requirements in the tactical and nontactical arenas.

DESCRIPTION: Transportation Coordinator-Automated Information Movements System II (TC AIMS II) will consolidate management of the unit/installation-level transportation functions of Unit Movement, Load Planning and Installation Transportation Office/Traffic Management Office (ITO/TMO) operations into a single automated capability for use throughout DoD. Reducing systems redundancy, functionalities of unit movement, load planning and ITO/TMO transportation AISs will be migrated into its applications. TC AIMS II will provide a common hardware suite running software applications designed for easy data retrieval, data exchange and connectivity to relevant external sources. Open systems architecture is emphasized throughout for standardization and interoperability and for ease of system growth and maintenance. The September 1995 PDM II provided the Army with FY97 funding which is shown under BD3000, Logistics Automation (BE4166). The Principal Deputy Under Secretary of Defense designated the Army as lead service for TC AIMS II in November 1995 and directed realignment of legacy system funding in the Army budget in FY98 and out. The August 1996 PDM I directed that hardware would be funded and provided by each service.

JUSTIFICATION: The TC-AIMS II program must upgrade the TC-ACCIS servers and workstations to be compatible with Defense Information Infrastructure/Common Operating Environment (DII/COE). FY99 funding procures Year 2000 compliant hardware upgrades at existing TC-ACCIS sites. This is a variably configured system based on the COMPAQ 4500 servers and Pentium-based workstations.

DESCRIPTION:

The Joint Tactical Terminal (JTT)/ Commander's Tactical Terminal (CTT) are a family of special application UHF Line of Sight (LOS)/ SatelliteCommunications (SATCOM) Secure Intelligence dissemination reporting system for deployment with tactical units. The system uses airborne and satellite relay platforms to provide robust, reliable jam resistant targeting and intelligence data and voice connectivity throughout the battlefield. Data from various sensors and HUMINT sources are transmitted over the Integrated Broadcast Service (IBS). Specific IBS transmission networks include the Tactical/ Reconnaissance Exchange System (TRIXS) network, the Tactical Information Broadcast Service (TIBS), Tactical Related Activities (TRAP) Data Dissemination System (TDDS), and Tactical Data Information eXchange System (TADIXS) networks. In addition, the terminals can also employ generic Ultra High Frequency (UHF) frequencies.

The IBS is the worldwide DOD standard Network for transmitting tactical and strategic intelligence and battle management data. Starting in FY98 the CTTs produced will begin migration towards the objective Joint Tactical Terminal (JTT) configuration, utilizing individual Common Integrated Broadcast Service-Modules (CIBS-M). The CTT has a 3 channel capability with 3 Receivers and 1 Transmitter. The JTT is the next generation DOD standard system which provides 8 receive, and 1 transmit channels, higher data throughput and module design.

The JTT and CTT 3 terminals deliver critical, time sensitive battlefield intelligence and targeting information at collateral and system high security levels in near real time to the worldwide tactical commanders and intelligence nodes at all echelons. The terminals provide direct, secure and dedicated connectivity/interoperability for rapid targeting, threat avoidance, battle management, mission planning and sensor cueing. The equipment can be mounted in fixed and rotary wing aircraft as well as fixed or mobile ground platforms. The JTT and CTT 3 facilitates, reaction inside the enemy decision cycle and is necessary to winning the information war on the battlefield.

JUSTIFICATION: The FY 99 funding procures JTT hardware to meet specified user requirements. FY 99 quantities include receive only and full duplex (receive/transmit) variants based on user identified requirements. JTT is a part of the Armv's high priority initiative to digitize the battlefield.

REMARKS:

The FY 96 JTT contract was awarded and protested. The contract was recompeted and awarded in Sep 97.

The first FY 96 CTT delivery is not an Army delivery. The first Army delivery is scheduled for Dec 97.

DESCRIPTION: Ground Based Common Sensor (GBCS) is an absolute win the battlefield information war element. GBCS provides the Commanders of Army Divisions, Armored Cavalry Regiments and Separate Brigades with an organic capability to listen to, precisely locate for hard kill or order-of-battle resolution, or render threat command and control and fire control communications nets ineffective through electronic attack. GBCS provides capability to identify and precisely locate threat counter/mortar, counter/battery and ground surveillance radar emissions. The system is in two configurations specifically designed to ensure transportability, prime mover maintainability, and over terrain mobility equal to that of the supported divisions, regiments and brigades. GBCS-Light is in a High Mobility Multipurpose Wheeled Vehicle (HMMWV) for deployment with first to fight, Light, Airborne and Air Assault elements in support of contingency operations. GBCS-Heavy is configured on a derivative of the Bradley Fighting Vehicle System, the Electronic Fighting Vehicle System (EFVS). The EFVS development and procurement is in concert with the Command and Control Vehicle (C2V) for deployment with Heavy and Armored units. It will be the Army's only on-the-move, all weather, all terrain, self-contained, fully integrated, 24-hour-a-day, signals intelligence and electronic attack asset.

GBCS exploits or eliminates, at the Commander's discretion, the latest most modern types of hostile modulations including modern radar and Low Probability of Intercept (LPI) communications, and transmissions techniques at the key time and place on the battlefield. When deployed in conjunction with Advanced QUICKFIX, its heliborne counterpart, GBCS provides for targeting accuracy sufficient for first round hit by organic artillery.

GBCS mission equipment is also being configured in a Light Armored Vehicle (LAV) for use by the United States Marine Corps. The program must be considered as a whole with GBCS-L, GBCS-H and AQF. All three programs leverage the others funding.

DESCRIPTION: The Gun Laying and Positioning System (GLPS) will be a modular, lightweight, cost effective Non-Developmental Item (NDI) that will give each towed and self-propelled non-Paladin firing battery autonomous positioning and directional capability. The GLPS will rapidly self-locate and determine azimuth/deflection and position (Universal Transverse Mercator (UTM) coordinates and altitude) of each howitzer from one centrally located orienting station. The GLPS will consist of a tripod mounted gyroscope integrated with an electronic digital optical instrument, eye-safe laser rangefinder, and transport case(s). Use of the GLPS also requires the AN/PSN-11 Precision Lightweight Global Positioning System (GPS) Receiver (PLGR).

JUSTIFICATION: This system will decrease the time required to survey and lay a howitzer battery from 2 hours to 14 minutes. The GLPS will displace one of the two Position and Azimuth Determining Systems (PADS) and the associated PADS crew within each Field Artillery Battalion. The FY99 funding is a continuation of FY97-98 Warfighter Rapid Acquisition Program (WRAP) production of Test Articles and Operational Prototypes. FY99 funding will buy the initial quantity of GLPS to be fielded to the active Army and National Guard as a Type Classified-Standard weapon system. Procurement and fielding of the 66 GLPS to be purchased with FY99 funds will facilitate displacement of 11 Position and Azimuth Determining Systems (PADS) and 22 PADS crew personnel.

DESCRIPTION: The Joint Surveillance Target Attack Radar System (Joint STARS) is a surveillance battle management and targeting system. It is a Joint Army and Air Force program with the Air Force as the executive service. The Joint STARS Radar is an airborne multimodal radar system incorporating an electronically scanned antenna and combines both Moving and Fixed Target indicator (MTI/FTI) and Synthetic Aperture Radar (SAR) functions. The radar is carried aboard a modified E-8 aircraft (AN/TSQ-XXX) and broadcasts radar data to the Army Ground Station Modules (GSM) through an omnidirectional data link. In addition to Joint STARS data, the GSM will receive and process Unmanned Aerial Vehicle (UAV) and Commanders Tactical Terminal (CTT) data. The GSM is a tactical data processing and evaluation center that links the Joint STARS carried aboard the Air Force E-8 aircraft to the Army C3I Tactical Fire Direction System (TACFIRE) and All Source Analysis System (ASAS) nodes at the Corps, Division and Brigade levels. The GSM will assist commanders in determining battle management and targeting. As of FY96, Joint STARS Ground Stations will incorporate Secondary Imagery Dissemination and other enhancements via an approved Pre-Planned Product Improvement (P3I) program These production line engineering change proposals (ECPs) will bring about the evolution of the GSM into the Army's Common Ground Station (CGS). The CGS will integrate signal, imagery and other intelligence processing into a single ground station, resulting in enhanced battle management capabilities. The Joint STARS will fulfill an urgent air-land battlefield deficiency by providing an Army/Air Force battlefield sensor and attack control capability designed to detect, locate, track, classify and assist in attacking both moving and stationary ground targets beyond the Foward Line of Troops (FLOT).

JUSTIFICATION: The FY99 funds procure 20 units. The Army has a demonstrated critical requirement for a world-wide deployable ground station capable of processing and reporting radar intelligence and imagery intelligence obtained from a variety of airborne platforms (e.g. Joint STARS, objective deep Unmanned Aerial Vehicle (UAV), close UAV, and allied aerial platforms). The Joint STARS Ground Stations has repeatedly provided high value targeting and intelligence data to Field Commanders during contingencies (Operation Joint Endeavor), as well as during standard mission operations of fielded units. The CGS has proved to be a significant battle management asset to the Ground Commander. Joint STARS is a proven force multiplier, fielded to high priority units for worldwide deployment.

DESCRIPTION: The Integrated Broadcast Service (IBS) is the worldwide DOD standard network for transmitting tactical and strategic intelligence as well as battle management data. Starting in FY98, all DOD systems requiring access to the IBS will gain this access via a new family of common IBS modules (CIBS-M) and Joint Tactical Terminals (JTT). The initial CIBS modules will begin production in FY98 and ultimately upgrade all IBS migration tactical terminals currently in use by the services. Prior to the initiation of the CIBS-M program the services received the IBS Broadcast via the Commander's Tactical Terminal (CTT). The CTTs will require modifications to maintain accessability and interoperability with the IBS Broadcasts. This will be done via CIBS-M.

JUSTIFICATION: The IBS plan directs that the Broadcast Networks maintain a standard technical configuration/approach that necessitates modifications to existing tactical terminals. The current support to Army, Air Force, Marine and Navy units provided via CTT must be maintained beyond the year 2005. The CTTs are integrated into numerous weapon systems and provide near real time intelligence data. The modifications funded via this program insure the continued receipt of this information and intelligence data by USA forces worldwide.

The FY99 funds are required to complete the modifications of fielded CTTs to allow them to maintain compliance and compatibility with evolving network standards. This includes a major upgrade to the terminal processors, replacement of the outdated COMSEC Circuitry with the current DOD standard chips, and addition of DAMA module.

INDIVIDUAL MODIFICATION Date February 1998

MODIFICATION TITLE: MIGRATION SYSTEM PROCESSOR UPGRADE 1-97-XXX2

MODELS OF SYSTEMS AFFECTED: CTT's

DESCRIPTION / JUSTIFICATION:

The Integrated Broadcast Services (IBS) Plan mandates that a Common capability and signal parameter be identified and implemented to maintain and insure oversight of the Broadcast networks and commonality/interoperability of all tactical terminal/receivers.

As the IBS networks migrate to the Common Standard, existing systems in the field must pace the networks progression or face obsolesence through the enabling to interoperate with the evolving standards.

This modification replaces existing processors in the CTTs with a standard, logical oriented process that will simplify future upgrades, reduce O&S costs and extend the operational life of the current field assets.

INDIVIDUAL MODIFICATION

MODIFICATION TITLE: COMSEC CIRCUITRY REPLACEMENT 1--97-XXX3

MODELS OF SYSTEMS AFFECTED: CTT's

DESCRIPTION / JUSTIFICATION:

The Integrated Broadcast Services (IBS) Plan mandates that a Common capability and signal parameter be identified and implemented to maintain and insure oversight of the Broadcast networks and commonality/interoperability of all tactical terminal/receivers.

The networks have directed the integration of new circuitry and standard chips to be included in all terminals to meet COMSEC requirementally represented this modification will render all existing CTTs (procured FY95 and prior) non mission capable.

MODIFICATION TITLE: DAMATIZATION 1-97-XXX4 MODELS OF SYSTEMS AFFECTED: CTT'S DESCRIPTION / JUSTIFICATION: JCS has mandated thatall MILSATCOM UHF terminals be Demand Assigned Multiple Access (DAMA) compliant because of increasing communications load on the present MILSTACOM architecture across the theater CINCs. OSD (C3I) has directed that the JTT be DAMA compliant regardless of present IBS Network capabilities and requirements. It is anticipated that IBS will implement DAMA. This modification will provide the capability for the CTT as a migration system to be DAMA compliant along with the objective JTT system and comply with JCS mandates. DESCRIPTION:

The current terrain analysis, topographic and reproduction support provided by Army Engineer Terrain Teams are slow, labor intensive processes that do not meet the needs of the Force XXI digitized battlefield in which the commander must have the ability to rapidly obtain terrain information and topographic products such as cross-country movement, concealment, supply routes, avenues of approach, and line of sight. The Combat Terrain Information Systems (CTIS) Modernization Plan, approved in Apr 94 by the Combat Developer, stated the requirement to proceed immediately with the Downsized DTSS configuration and further identified that Quick Response Multicolor Printer functionality would be incorporated in the DTSS for a single integrated terrain analysis and reproduction capability. It has been determined that the downsized capability is now more appropriate to support highly mobile contingency operations, stability and support operations, and split based operations. The DTSS/QRMP will be deployed at Division, Corps, and Echelons Above Corps in support of these missions. The DTSS/QRMP will automate the updating and processing of terrain information into terrain analysis products, provide rapid reproduction of low volume, up-to-date, large format, full color imagery maps, situation overlays, special graphics (e.g., captured enemy maps) and other topographic and terrain products. Part of imagery exploitation includes the development of a Multispectral Imagery Processor (MSIP), which provides an image map making capability. Due to current world events and the possibility of contingency missions in areas where standard map products are not available, image map production has become an urgent need. The CTIS program office was tasked with the mission to issue the DTSS-MSIP as an interim measure to topographic units. Delivery of the DTSS-MSIPs was completed in Jun 95. Enhancements to the DTSS-MSIPs have been issued to all of the active duty topographic units and includes the delivery of upgraded software and scanners. CT

DESCRIPTION: The Defense Message System (DMS) provides regional, installation level and user interfaces to DOD record communications services Armywide. The program is currently transitioning from Phase I to Phase II. Replacement of the AUTODIN Mail Server (AMS) Desktop Interface to Automatic Digital Network (AUTODIN) Host (DINAH), Automated Special Security Information System Terminal (ASSIST) and other AUTODIN terminals are DMS Phase I actions. Phase I is completed. Phase II focuses on the full scale implementation of Consultative Committee on International Telegraphy and Telephony (CCITT) standardized X.400/X.500 messaging products and the phase down of the AUTODIN system. This process began in FY 95 and will continue under current funding levels through FY 00. Installation locations have been identified and installation/implementation staffing has been allocated. The new message system will feature: (1) A user operated service concept, (2) A single form of message service using a simplified message format, (3) Multilevel secure processing and (4) Automated local distribution via information transfer networks.

JUSTIFICATION: FY 99 funds continue to procure DMS compliant components from the Air Force sponsored DMS Government Open System Interconnection Profile (GOSIP) contract. These components consist of the User Agent e-mail software package, the Profiling User Agent (PUA), Secure Network Servers (SNS) and Subordinate Mail Transfer Agent/Message Store (SMTA/MS). FY 99 procurements will be expanded to include the Tactical Messaging System (TMS). As DMS GOSIP is phased in, AUTODIN will be phasing out. The phase-out, of AUTODIN Switching Centers (ASC), is expected to be completed by 31 December 1999 at an estimated 201 sites.

DESCRIPTION:

Integrated System Control (ISYSCON) will provide an automated method for managing the tactical communication network, establish an interface with each technical control facility and other non-signal management in the ATCCS architecture, and enable automation assisted configuration and management of a dynamic battlefield. The major functions of ISYSCON are network planning, signal command and control, spectrum management, wide area network management and COMSEC management. ISYSCON has been involved in TFXXI and DIVXXI experiments and requirements definition is ongoing for implementation in the tactical internet for FY 98 and FY 99. The ISYSCON program serves as a baseline foundation to support the network management initiatives tied to or part of the evolution to the Digitized Division/Corps and the Warfighter Information Network (WIN) architecture. ISYSCON program provides the network management for WIN-Terrestrial (WIN-T) and solves significant shortcomings in today's network management. ISYSCON will serve as the foundation on which to build the WIN-T network and will serve as the Army baseline for joint communications management. ISYSCON production will utilize the Echelons Corps and Below (ECB) and downsize Echelons Above Corps (EAC) hardware as a building block baseline towards fulfilling the objective design.

JUSTIFICATION:

FY 99 funds will be used in support of the objective ISYSCON configurations and will consist of new government/contractor off-the-shelf hardware and software. FY 99 supports ISYSCON systems required for First Digitized Division (FDD) and Corps (FDC). Seamless network management from theater to the objective digitized division is a necessary requirement for the Warfighter Information Network/information dominance. Reference MEMO from DCSOPS, DAMO-FDC, Subject: Warfighter Information Network (WIN) Network Management/Information Dominance requirements dtd 10 Jan 97.

Description: The Tactical Exploitation of National Capabilities (TENCAP) Program provides tactical commanders with rapid access to critical information collected by National Intelligence Sources. To date, the program has been responsible for provisioning the AN/TSQ 134(V) (Advanced Electronic Processing and Dissemination System (AEPDS), the Forward Area Support Terminal (FAST), the Mobile Integrated Tactical Terminal (MITT) and the emerging Tactical Exploitation System (TES) to Army Echelons Above Corps, Corps and maneuver divisions. All systems are characterized as stand alone systems, with multiple communications capability defined in UHF S-Band and terrestrial communications packages, and with the exception of FAST, systems are contained in shelters or vans, with a dedicated primemover and system operators. The TENCAP Program also manages the Enhanced Tactical Radar Correlator (ETRAC) and the Modernized Imagery Exploitation System (MIES) which are funded under the Defense Airborne Reconnaissance Office (DARO), PE 0305154D Defense Airborne Reconnaissance Program (DARP).

Further information may be found at the Tactical Intelligence and Related Activities (TIARA) Congressional Justification Book, Volume II and the Army's TENCAP Master Plan.

Justification: The FY98/99 funds procure both military and commercial hardware and software (GOTS/COTS) capabilities to enhance TENCAP systems' performance and to maintain interoperability with National systems and Army tactical communications architecture. The Units procured under this line are components that are incorporated into all TENCAP systems (including ETRAC and MIES) and fall under the TENCAP Common Baseline Project, which addresses common subsystems, planned improvements, key activities and ongoing/planned intiatives determined to have potential application to multiple TENCAP systems.

The Joint Tactical Ground Station (JTAGS) Modification program will integrate into JTAGS, the Joint Tactical Information Distribution System (JTIDS) which will distribute JTAGS data via the Joint Theater Missile Defense (JTMD) communication nets; fuse Defense Support Program (DSP) sensor data with data from other sensors for improved cueing and predicted ground impact point (PGIP) accuracies; and calibrate sensor location via static sources or beacons.

JUSTIFICATION:

FY99 funding procures and integrates JTIDS radios into JTAGS which are needed to interface directly with the Joint Theater Warning Net.

INDIVIDUAL MODIFICATION Date February 1998 MODIFICATION TITLE: Sensor Fusion TBD1 MODELS OF SYSTEMS AFFECTED: Data Processing Subsystem DESCRIPTION / JUSTIFICATION: The Sensor Fusion modification adds the capability to integrate other sensor data with Defense Support Program (DSP) data to improve accuracy of the predicted gound impact point (PGIP) and state vector. JTAGS currently receives and processes data from the DSP constellation of satellites only. The overall accuracy and utility of data provided to theater forces could be greatly enhanced and reduction in system performance risk obtained from fusion of DSP data with data from other sensors. Fusion is currently a growth requirement in the JTAGS Operational Requirements Document (ORD). Fusion will allow the program to move toward the required PGIP Program Objective. INDIVIDUAL MODIFICATION Date February 1998 MODIFICATION TITLE: Beacons TBD2 MODELS OF SYSTEMS AFFECTED: Data Processing Subsystem DESCRIPTION / JUSTIFICATION: Bias removal techniques (such as beacons or other meaures) adds the ability to improve the Estimated Launch Point (ELP) accuracy. Lir sight errors have been significantly reduced by the use of existing bias removal techniques. This effort will evaluate means of achieving greater accuracy through selective use of additional bias elimination methods. A study will be conducted initially to identify the most effe means of implementing this improvement. This effort is required to achieve the ELP program objective. DESCRIPTION: TROJAN is a combined operational and readiness mission system which uses advanced networking technology to provide rapid radio relay; secure communications and electronic reconnaissance support to U.S. forces throughout the world. TROJAN operations may be easily tailored to fit military intelligence unit training schedules, and surged during specific events to involve every aspect of the tactical intelligence collection, processing, analysis and reporting efforts.

TROJAN consist of four subsystems: remote receiver groups, located at border sites; monitor control groups to include analyst workstation groups, located at unit garrisons; digital data switching group which provides the automated switching capability; and switch extensions which provide operational control, intelligence dissemination, administrative and logistics functions.

JUSTIFICATION: FY99 funds for collection and processing system upgrades and migration to a National Common Remoted Systems (CRS) architecture.

DESCRIPTION: The TROJAN SPIRIT II is a collection of electronics equipment which provides contingency forces with an operational readiness capability providing an intelligence processing and dissemination system consisting of secure voice, secure data, secure facsimile and secondary imagery worldwide via an organic long haul satellite communications network split-based, multi-echelon force projection operations.

TROJAN SPIRIT II systems consist of five major subsystems: power generation subsystem; communications subsystem (C, Ku, X Bands; (HF/MSE/CTT receive only) UHF SatCom); prime mission movers with shelters; and communications interface equipment.

JUSTIFICATION: FY99 funds to provide intelligence/communications enhancements to the TROJAN automated switching architecture and TROJAN Network Control Center (TNCC).

DESCRIPTION: The Common User Installation Transport Networks (CUITN), fielded under this program, are part of the Installation Information Transfer Systems Improvement Program (IITSIP) designed to improve data communications transfer capabilities at Army installations. This program provides state-of-the-art, highspeed, common-user, data backbone networks and includes the hardware, software and interfaces to both site internal and external systems, networks and terminals, and turnkey approach to the implementation of these networks. The backbone network provides the capability for connections to site workstations, data processing installations, mainframes, and networks while providing access to gateways on the site and the Defense Information Systems Network (DISN) Wide Area Network (WAN) external to the site. The Army is currently utilizing outdated systems, obsolete overstressed telephone resources, and expensive non-standard interim measures to satisfy the increasing data communications requirements. The installation backbone CUITN program will ensure a smooth transition to the Army's longterm objective architecture. The Army has increased the number of computers in use at installations Army wide. Fielding of these systems and workstations coupled with changes to and fielding of interactive databases for Standard Army Management Information Systems (STAMIS), which require the movement of large amounts of data quickly, has placed the need for increased services on installation information transfer systems. Users, whether in garrison or deployed in support of CONUS-Centric Power Projection Strategy, require access to databases, Data Processing Centers, other networks on their home installation, and common user capabilities of the DISN. This expansion of data transfer has overloaded the installation data transfer capabilities. To satisfy installation data transfer requirements, it is necessary to upgrade the base communications infrastructure via replacement/upgrade of switches/cable facilities and procurement of CUITN backbone networks. The CUITN backbone will complement the Integrated Services Digital Network (ISDN) when this capability becomes available. The CUITN backbone provides the means for transferring information within the confines of the Army's posts, camps and stations and will be provided by a mix of resources, depending on the switching technology used at an installation, the installation's information transfer requirements, and availability of funds. The technical make-up of each backbone will be determined on a case-by-case basis and may have gateways to the DISN, tenant organizations (including tactical units), and the Open Systems Interconnection (OSI) protocols as identified by the Government OSI Profile (GOSIP).

DESCRIPTION: This budget line funds Armywide requirements for base support radio systems, and test, measurement and diagnostic equipment (TMDE) for US Army Signal Command (USASC). Base support radios are used by installation military police, fire departments, medical personnel and other emergency-response activities to coordinate critical response to time sensitive emergencies and for support during mobilization, deployment and split-based operations. Base support radio systems will permit users to share frequencies, thus conserving scarce radio spectra and will provide secure voice/data transmission and access to local telephone systems from portable hand-held radios. The Federal Communications Commission (FCC) and National Telecommunications Information Administration (NTIA) have drastically reduced the available frequencies throughout CONUS. In Korea, the Ministry of Communications (MOC) will implement Phase 2 changes to operational bandwidth and channel separation criteria for Very High Frequency (VHF), Commercial Land Mobile Radios (CLMR) by FY 04, at which time existing radios will be obsolete because they cannot be modified to add the new frequency. Mission capability of law enforcement, security and other base forces during mobilization, deployment and split-base operations would also be greatly constrained without adequate communications capability. This program also supports the replacement of obsolete, nonsupportable TMDE and interim mission support for command, control, communications and computers worldwide. The USASC TMDE inventory consists of general purpose and special purpose test equipment. This command's capability is maintained through phased replacement of obsolete, nonsupportable TMDE. Additionally, long lead times for acquisition of new TMDE results in this program supporting interim acquisition of special purpose TMDE to satisfy mission requirements. Densities of TMDE supported by this program are determined by Defense Information Systems Agency (DISA) standards and maintenance support p

JUSTIFICATION: FY99 funds upgrade or replace base support radio systems that US Forces Command (FORSCOM) and Eighth US Army (EUSA) have identified as critical requirements. Based on the USASC 5-Year TMDE Acquisition Plan, FY 99 funds will purchase replacement TMDE, which include such items as transmission test sets, plotters/recorders, spectrum analyzers, signal sources and interim support of specialized test equipment which is authorized by approved documents. Interim support includes procurement of local area network/wide area network (LAN/WAN) diagnostic equipment and fiber optic test equipment. These funds will also provide replenishment and for rebuild of high-dollar, unique test equipment that has been deemed irreparable through standard Army repair systems. All procurements are designed to satisfy increases in authorization levels due to expanded mission requirements based upon critical need and the five year TMDE Acquisition Plan.

DESCRIPTION: The Maneuver Control System (MCS) is an automated tactical Command, Control and Communications (C3) system which provides a network of computer terminals to process combat information for battle staffs. It provides automated assistance in the collection, storage, review and display of information to support the commander's decision process. Both text and map graphics are provided to the user. It enables operation staffs, G3/S3, to process and distribute estimates, plans, orders and reports. The system is designed to operate with existing and planned communications networks. This is an evolutionary development including planned system improvements to insure increasing Command and Control (C2) capabilities and infusion of current technology while, in the interim, providing an essential core capability.

JUSTIFICATION:

MCS is the key to the commander's situational awareness and common picture of the battlefield. It will incorporate all fire support, intelligence, air defense, logistics, and maneuver information concerning friendly and enemy forces, and then enable the commander to effectively make decisions, issue orders, allocate resources, and fight the battle.

The MCS Common Hardware/Software (CHS) equipment is needed to equip the active force with an automated C2 capability. This program is an integral part of the Army Tactical Command and Control System (ATCCS) and is critical to the successful operation of the overall system. This generation of computers will incorporate advances in technology and achieve Life Cycle Cost savings due of commonality to support.

FY99 funding of \$13.0M will be required to purchase equipment for 4th Infantry Division, Special Operations C2 elements and HQ XVIII ABN Corps.

DESCRIPTION: The Army Broadcasting Service (ABS) is the DOD Executive Agent for the Army's Armed Forces Radio and Television Service (AFRTS) operations. AFRTS provides overseas warfighting Commanders-in-Chief (CINCs) with radio and television mass communications during peacetime, emergency, contingency and wartime operations in accordance with DOD Directive 5122.10, and serves DOD personnel overseas with American language news, command information and entertainment programming. Geographical areas served by Army AFRTS facilities are Germany, England, Scotland, Italy, Spain, the Middle East (including the Sinai, Saudi Arabia and Kuwait), Korea, Central and South America, and the Marshall Islands. Four Army radio and television networks, consisting of approximately 360 radio and television facilities, broadcast continuous 24-hour programming to nearly 500,000 soldiers, sailors, airmen, marines, DOD civilians and their families worldwide. AFRTS is the only mass communications available to overseas commanders to communicate time-sensitive emergency health and welfare announcements, command information and news. Overseas wartime operational CINCs consider AFRTS a battlefield support function that is critical in maintaining and enhancing the morale, readiness, and well-being of overseas troops, DOD personnel and their families. Overseas availability of the AFRTS communications service has become increasingly important to disseminate timely information as the Army downsizes and shifts resources in support of contingency, peace keeping and wartime operations such as Desert Shield/Storm and Operations Just Cause, Restore Hope, Provide Promise, Safe Haven, and Joint Endeavor. Congress mandates that AFRTS provide the same type of radio and television service to personnel overseas which is available to American citizens in the United States.

JUSTIFICATION: FY 99 funds purchase commercial video switching/control systems and a video server system. Equipment purchases support fixed facilities and full spectrum contingency operations such as Desert Storm, Operation Deny Flight, Operation Support Hope (Rwanda, Uganda, Zaire), PREPO AFLOAT, Joint Task Force Bravo (Honduras), Zagreb, Macedonia and Bosnia to ensure warfighting CINCs have required AFRTS resources to execute wartime and contingency/emergency information needs. In addition to health, safety and quality of life issues, "Observations and Lessons Learned, Operation Desert Storm," validated Army AFRTS as a force multiplier and Battlefield Support Agency. Army AFRTS, through its primary mission of command information, serves as an information conduit for the battlefield commander. The mass communications broadcast mission of AFRTS is not duplicated by the strategic communication mission of the Army or other services and is the only means of direct communication from the President of the United States to US deployed forces. Overseas force reductions, force realignment, post-Conventional Forces Europe (CFE), troop strength reductions in Korea and overseas base closures have been considered and do not impact the equipment required to sustain the basic broadcast capability to remaining forces.

DESCRIPTION: The Army Defense Information System Network (DISN) Router Program (ADRP) addresses Army requirements for DISN connections. The DISN includes both the Unclassified IP Router Network (NIPRNET) and the Secret IP Router Network (SIPRNET). The ADRP includes the acquisition of routers, access servers, modems, and associated networking and management devices necessary to connect Army host computers, terminals and Local Area Networks (LANs) to the DISN. Program acquisition also includes installation, Installation Bill of Material (IBOM), training and maintenance. The routers and access servers are tailored to data requirements at each Army location and are expandable to meet changes in data requirements. The routers are also upgradable to future Army, DOD and industry standards. Reducing the number of connections required to support Army DISN requirements avoids multiple router connection charges with each associated DISN connection. The ADRP is an integral part of the Power Projection Command, Control, Communications, and Computer Infrastructure (P2C4I) initiative. The overall objectives of P2C4I are to: (1) support communications requirements of deployed forces and their access to home installation sustaining base systems, and (2) emplace information systems in a coordinated, synchronized, integrated manner, thereby optimizing funding/personnel resources and maximizing the operational benefits. P2C4I identifies the cooperative role and responsibility for installations in the active, direct execution of the National Military Strategy to project forces beyond the borders of the United States to anywhere in the world with little advance notice.

JUSTIFICATION: FY 99 funds add new capability in the DDN usage reduction effort, provide more capacity for data communication users and reduce the time to acquire services. FY 99 funds will procure 22 Routers and 23 Access Servers. FY 99 funds, also provide for the program management and engineering support to the ADRP.

DESCRIPTION: The ELECTROMAGNETIC COMPATIBILITY PROGRAM (EMCP) ensures readiness and effectiveness of command control communications systems through the testing of tactical and strategic systems for electromagnetic compatibility (EMC) with other civil or defense communications-electronics (C-E) systems operating within their environment. This includes the need to conduct EMC surveys at proposed and existing C-E sites intended for upgrade or planning for frequency resources. This is done to avoid expensive reworking or retrofitting. Propagation engineering is required in designing new networks and C-E equipment. Unique computer models are developed, upgraded and maintained for calculating EMC, propagation predictions, and engineering analyses. These models perform systems analyses for: (1) line of sight; (2) high frequency skywave and groundwave; (3) meteor burst; (4) tropospheric scatter communications systems; (5) antenna performance; and (6) spectrum management.

JUSTIFICATION: The EMCP requires the procurement of the following replacement and enhancement equipment to sustain the program.

- A. EMC MEASUREMENT EQUIPMENT: Used to conduct EMC surveys to characterize the electromagnetic environment. Surveys are used to measure spectrum occupancy, detect interference, and eliminate electromagnetic hazards.
- B. SPECTRUM ANALYZERS: Display and record the frequency domain and transmission characteristics of the radio frequency signals acquired.
- C. DIRECTOR OF INFORMATION MANAGEMENT (DOIM) ARMY INTERFERENCE RESOLUTION PROGRAM (AIRP) UPGRADE: These systems include handheld direction finding equipment and computers to run frequency management software (AFSMS) and other electromagnetic interference (EMI) software to be supplied to Army DOIMs worldwide to resolve radio frequency interference (RFI) problems. These systems will reduce the utilization of limited resources by correcting RFI problems at the DOIM level.

DESCRIPTION: Super High Frequency (SHF) Tri-Band Advanced Range Extension Terminal (STAR-T) is a Heavy High Mobility Multi-purpose Wheeled Vehicle (HMMWV) mounted, multi-channel Tactical Satellite Terminal (TACSAT). It has a tri-band capability in the Super High Frequency (SHF) range and will operate over commercial and military SHF satellites. Selected terminals will also have an integrated switch that will interface with both commercial and joint military switching systems. The STAR-T is being procured by the USMC and the Joint Communications Support Element (JCSE) and will replace the current TSC-85 and TSC-93 SHF multi-channel TACSAT terminals.

JUSTIFICATION: FY-99 funds will procure eleven STAR-T terminals. This program will replace the aging fleet of AN/TSC-85/93 terminals by providing tri-band communications capability for split based operations. The AN/TSC-85/93 terminals cannot meet the transportability and deployability requirements of a force projection Army, nor can they exploit commercial space as mandated by OSD. Prolonging the life of these terminals would result in rapidly escalating maintenance costs which negatively impact upon the O&M budget. The STAR-T will selectively replace all Ground Mobile Forces (GMF) terminals at Echelons Above Corps (EAC).

DESCRIPTION: The Pentagon Renovation Project is an on-going construction project directed by Office of the Secretary of Defense and implemented by a Resident Program Manager, Corps of Engineers (COE), and a Project Manager for Information Management & Telecommunications (PM, IM&T), U.S. Army Materiel Command (USAMC). PM, IM&T is responsible for relocating existing IM&T facilities while sustaining operations and implementing a new Pentagon IM&T physical and electronic infrastructure in concert with COE construction. Relocation includes moving the National Military Command Center (NMCC)/Service Operation centers, consolidating seven Telecommunications Control facilities, collocating 11 Automated Data Processing (ADP) facilities to two facilities, and consolidating 15 command and control, tactical, and administrative telephone switches to 8. The IM&T infrastructure includes the installation of an unclassified/classified backbone and a Network and Systems Management Center. The implementation of IM&T requirements is integral to each phase of the Pentagon Renovation construction program due to the synchronization of both programs. The Pentagon Renovation IM&T Project will provide modern integrated information and telecommunication capabilities to all levels of command in the Pentagon including OSD, the Joint Staff, the Army, Navy, Marine Corp, Air Force and Defense Agencies.

DESCRIPTION: This budget line includes funding for the Pentagon Telecommunications Center (PTC) and the Pentagon Renovation Information Management and Telecommunications Project. The Pentagon Telecommunications Center System (PTCS) provides, by Congressional mandate, General Service (GENSER) message origination and termination services for the headquarters of the military services, the Joint Chiefs of Staff, the Office of the Secretary of Defense, and many other DOD/non-DOD subscribers throughout the National Capital Region. In addition, the PTCS provides needed Automated Digital Network (AUTODIN) gateway access to civilian agencies, including the White House, Central Intelligence Agency and Departments of State, Energy, and Commerce. For the subscribers served, the system provides message services for command and control, crisis management, operational and administrative functions.

DESCRIPTION: The Worldwide Technical Control Improvement Program (WWTCIP) provides needed upgrades, expansion, and modernization of the Worldwide Defense Information Systems Network (DISN) technical control facilities in order to effect the integration and efficient operation of DCS digital transmission subsystems, and to reduce operating costs. This program provides DC power, timing and synch, line conditioning equipment, automatic technical control, digital patch and access system (DPAS), VF tactical interface, Defense Communication Systems TRI-TAC interface, and appropriate test equipment and associated hardware. WWTCIP supports worldwide communications transmission media and switching upgrades such as the Digital European Backbone (DEB), Korean Improvement Program, Japan Reconfiguration and Digitization, and Defense Satellite Communications. Program also funds the automation of Technical Control Facilities, as part of the Joint Chiefs of Staff (JCS) directed Korean C4I enhancements, under the Extended Korean Improvement Program (EKIP).

JUSTIFICATION: FY 99 funds will be used to install the matrix switch at Landstuhl, Germany. Although the Timing Systems have been upgraded with Global Positioning System receivers, the Clock Distribution Systems are antiquated and need to be replaced with logistically supportable and modern timing distribution systems. FY99 funds will facilitate upgrades at approximately 114 worldwide loccations.

DESCRIPTION: The Enhanced Manpack UHF Terminal (SPITFIRE) program replaces the existing inventory of single channel SATCOM radios to add Communications Security (COMSEC), and Demand Assigned Multiple Access (DAMA) capability to support all DoD, Special Operations Forces (SOF) and other Agencies. Joint Staff (JS) has mandated that all UHF satellite manpack terminals be secure and have DAMA capability. No other DoD manpack terminals possess the UHF DAMA capability, which allows more efficient use of limited satellite resources.

JUSTIFICATION: The FY99 funds will field SPITFIRE prior year procurements.

DESCRIPTION: Medical Communication for Combat Casualty Care (MC4) provides support to the medical force structure through the acquisition of existing and emerging digital communications equipment and information management/technology capabilities for modular hospital platforms and non-hospital units throughout the wartime theater of operations as well as peace operations, humanitarian assitance and operations in aid of civil authorities.

JUSTIFICATION: FY99 budget request supports requirements for the initial incremental fielding of Force Package 1 for far forward combat casualty care capability. It inserts new technologies into existing platforms and initiates implementation of Force XXI concepts through communication advancement to enhance medical treatment. Acquisition of specific equipment supporting MC4 are displayed in the attached exhibits.

DESCRIPTION:

The Navstar Global Positioning System (GPS) is a passive space based radio positioning and navigation system that provides position, velocity and time information to a user in three dimensions to 16 meters Spherical Error Probable (SEP). GPS User Equipment (UE) is a family of receivers that meet DoD requirements for Selective Availablity and Anti-Spoofing, provides the users with Precise Positioning Service (PPS), and is designed to accommodate the differing dynamic user environments to include handheld as well as host platforms. The Army acquisition strategy is to procure a mix of Non-Developmental Item (NDI) equipment that will satisfy all user/platform requirements while enforcing standardization in accordance with DoD policy. Current Army GPS UE includes the Miniaturized Airborne GPS Receiver (MAGR), (a NDI 5-channel set for Signal Warfare aircraft); the Precision Lightweight GPS Receiver (PLGR), (a NDI receiver for ground users and host vehicles); and the NDI Stand Alone Air GPS Receiver (SAGR) and the Cargo Utility GPS Receiver (CUGR), (satisfy Army requirements for low dynamic Army aviation in the non-modernized fleet). Future Army GPS UE will include the Defense Advanced GPS Receiver (DAGR) (handheld); GPS Receiver Applications Module (GRAM) (embedded); and GPS/Inertial Navigation System (GPS/INS) (GPS with INS back-up). This new UE is scheduled for fielding to the Army during the FY01-FY06 timeframe and will include significant anti-jam and anti-spoof capabilities as a result of the ongoing Navigation Warfare (NAVWAR) Program.

JUSTIFICATION:

The FY-99 program will sustain the Product Manager's administrative cost, upgrade PLGR software, continue to field receivers. It will also allow for participation in the joint service effort to enhance GPS receiver anti-jam and anti-spoof capabilities under the Navigation Warfare (NAVWAR) Program; to modernize GPS as a dual use technology; and to initiate procurement of the Defense Advanced GPS Receiver (DAGR). The FY-99 program will also allow for integration efforts for Army MAGR requirements.

DESCRIPTION:

Milstar Ground Command Post Terminals (GNDCP) - AN/FRC-181(V1) (fixed) and AN/TRC-194(V1) (transportable) terminals provide survivable, worldwide two-way anti-jam, and enduring voice and data communications. The Extremely High Frequency/Ultra High Frequency (EHF/UHF) command post terminals are designed for use with communications satellites which provide the next generation military satellite communications systems. GNDCP terminals are designed for high capacity command post operation to include a mission control segment interface, emergency action message dissemination, force direction, CINCNET operations, and full beam management. A contract for the remaining terminals was awarded in May 93 by the USAF. These terminals will be deployed for command, control, and special user missions, and will be operated and maintained by the Army. A total of seven (7) terminals were procured by the USAF for the Army and will be integrated into the Army Force Structure.

JUSTIFICATION:

Delivery of the US Air Force procured terminals to the Army for integration into the Army force structure began in Nov 93. The first Army terminal (Fort McPherson, GA) was accepted by the Army for operation in Feb 95. This project has been synchronized with and is in support of the Milstar Low Data Rate (LDR) spacecraft launches. The FY98 funds will be utilized for Total Package Fielding (procurement of support items, special tools, repair parts, GFE, and generators) for fielding the SHAPE, BE terminal. This terminal will be operated and maintained by Army personnel to support CINC and NCA missions. There are no FY99 funds.

DESCRIPTION:

SMART-T is a multi-channel satellite terminal required to support a Force Projection Army. It will provide range extension capability to the Army's Mobile Subscriber Equipment (MSE), a critical requirement demonstrated during Operation Desert Storm. Specifically, SMART-T will provide a satellite interface to permit uninterrupted voice/data communications as our advancing forces move beyond the MSE Line of Sight capability. These terminals will triple the battlefield capability with respect to Command, Control and Communications. SMART-T will provide connectivity between selected MSE Node Centers (NC), Large Extension Nodes (LEN), Small Extension Nodes (SEN), and Remote Radio Access Units (RAU), to support Echelons Corps and Below as well as Special Contingency Operations, and communicate with other service Milstar terminals. It will transmit in Extremely High Frequency (EHF) band and will receive in Super High Frequency (SHF) band. The terminal will operate at both Medium Data Rate (MDR) and Low Data Rate (LDR). It will be capable of unattended operation. SMART-T will have the inherent capability of low probability of interception and low probability of detection (LPI/LPD) to avoid being targeted for destruction, jamming, or eavesdropping. SMART-T is interoperable with all other Milstar terminals and is interoperable with Milstar, Navy UHF Follow-on and any MIL-STD-1582 B/C compatible payloads.

JUSTIFICATION

FY99 funds procure 45 Full Rate Production (FRP) terminals and associated failure-free warranty for the US Army; completes Total Package Fielding of Low Rate Initial Production (LRIP) terminals to US Army; procures contractor logistics, fielding and training support services; conducts Milstar Intersegment Tests and completes Reliability Growth Test (RGT); installs and achieves operational capability of interactive training device at resident school facilities.

The SMART-T acquisition strategy was developed to optimize the fullest on-orbit capability of the Milstar Medium Data Rate (MDR) payload. The SMART-T will be the only fielded Milstar MDR capable terminal at the time of satellite launch.

The SCAMP BLK I Terminal will provide a manportable, four simultaneous channel, full duplex data/half duplex voice communications and data transfer system at 2400 bps each. These satellite terminals are to be employed by units that require range extension for command and control communications. Block I will provide priority tactical ground users with the capability to transmit and receive intelligence, command, and control traffic from a base station. It will transmit in the Extremely High Frequency (EHF) band and receive in the Super High Frequency (SHF) band. It will provide Low Data Rate (LDR) secure voice at 2400 bps and secure data at 75 2400 bps, as well as interface with Common Hardware/Software devices such as the Lightweight Computer Units and the Hand-Held Terminal Unit. The SCAMP BLK I will be fully interoperable within the Army C4I Technical Architecture. The terminal will have embedded COMSEC and TRANSEC with set-up and tear-down in less than 10 minutes. In addition to operation on Milstar satellites, the SCAMP BLK I will operate on all satellites which utilize the MIL-STD-1582C/D LDR waveform. It will be required to operate in environmental conditions that include smoke, aerosol, rain, fog, snow, haze and dust, and must operate in the transmit, receive or stand-by mode throughout an entire mission (typically 30 days). SCAMP BLK I is the first EHF manportable terminal and provides direct support to the tactical warfighter mobile forces with greater anti-jam protection, lower probability of intercept, and lower probability of detection.

JUSTIFICATION:

FY99 funds Total Package Fielding (TPF) of 93 Army Block I terminals procured in FY97, supports Joint Intersegment and Warfighter Interoperability Tests and incorporates modifications. Army Block I terminals are designated for Commanders at Division and Above levels. The DoD successfully launched two Milstar LDR EHF frequency waveband satellites in Feb 94 and Nov 95. SCAMP Block I provides manportable EHF/LDR communications in support of the on-orbit satellites.

DESCRIPTION: This is a roll line containing modification efforts in baby Standard Study Numbers as follows:

Mods for Intelligence Electronic Warfare (IEW) Heavy Force Systems (BZ9751) provide for Enhanced TRACKWOLF, AN/TSQ-199, materiel changes to provide Communication Satellite Intercept (CSI) capability and additional workstation positions for improved field reporting and increased collection and processing capabilities, and provide increased communication, flexibility and handling throughout the Direction Finding network. Enhanced TRACKWOLF is a High Frequency (HF) Skywave Communications Intelligence system which supports Echelons Above Corps commanders by supplying intelligence and targeting information to theater level All Source Analysis System.

Mods for IEW Light Force Systems (BZ9752) provide for three materiel change/upgrades to: (1) TRAILBLAZER, AN/TSQ-138, SINCGARS Interference Cancellation upgrade to resolve problems (hardware and software) associated with integration of the Single Channel Ground and Airborne Radio system (SINCGARS). SINCGARS is the new generation of Combat Net Radio (CNR). SINCGARS is replacing the AN/VRC-12 family of single channel radios. The integration of SINCGARS requires other hardware and software changes because of differences from the AN/VRC-12 series radios being replaced. (2) TEAMMATE (TM), AN/TRQ-32, Tactical Proficiency Trainer (TM TPT) materiel change will allow the unit commander to conduct operator sustainment training as required while the operator personnel are in garrison on their own system. Operationally, the concept design works by injecting a modulated Radio Frequency (RF) signal into the TM's RF Distribution Unit from which simulations could be made for the TEAMMATE system with a realistic environment simulator that will simulate communication intercept, AN/TSQ-32A(V)2 Direction Finding (DF), DF net, and Command, Control and Reporting capabilities as part of the TM systems function. (3) The AN/PRD-13(V)2 provides for an organic system that can intercept, DF and provide threat warning and situational awareness information directly to the support unit. The system is modular, very light weight, with minimal power requirements and configurable to support man-pack operations. Due to a number of operational and technical reasons, and changes in tactical Signals

INDIVIDUAL MODIFICATION Date February 1998 MODIFICATION TITLE: SINCGARS Interference Cancellation 1-91-07-0003 MODELS OF SYSTEMS AFFECTED: AN/TSQ-138(TRAILBLAZER) DESCRIPTION / JUSTIFICATION: This Materiel Change will resolve problems (hardware and software) associated with integration of the Single Channel Ground and Airborne Radio system (SINCGARS) into Intelligence Electronic Warfare (IEW) systems. SINCGARS is the new generation of Combat Net Radio (CNR). It is replacing the AN/VRC-12 family of single channel radios. Fieldings are scheduled to continue through FY98 until all of the Arm is converted to SINCGARS. SINCGARS provides effective Electronic Counter-Countermeasures (ECCM) by randomly hopping to preassigned frequencies. This random hopping causes anomalies in IEW mission equipment which requires hardware/software changes. In addition, its integration into IEW systems requires other hardware and software changes because of differences from the AN/VRC-12 series radios being replaced. DEVELOPMENT STATUS / MAJOR DEVELOPMENT MILESTONES: Planned Accomplished Inprocess Review/Production Decision Sep 93 Sep 93 Mar 94 Contract Award for 3 Models Mar 94 Jun 96 Jun 96 **Competitive Production Contract Award** Materiel Fielding Agreement/MWO Field Plan Negotiated Feb 98 First Kit Applied Oct 97 Last Kit Applied Dec 99 Installation Schedule: Pr Yr FY 1997 FY 1998 FY 1999 FY 2000 FY 2001 Totals 1 Inputs 10 3 Outputs 10 FY 2002 FY 2003 FY 2004 FY 2005 To **Totals** Complete 37 Inputs Outputs 37 METHOD OF IMPLEMENTATION: ADMINISTRATIVE LEADTIME: Months PRODUCTION LEADTIME: 14 Months Dec 96 Contract Dates: FY 1997 FY 1998 FY 1999

INDIVIDUAL MODIFICATION Date February 1998 TEAMMATE Tactical Proficiency Trainer (TPT) 1-93-07-0002 MODELS OF SYSTEMS AFFECTED: Radio Set, Receiving AN/TRQ-32, SSN: V07700 DESCRIPTION / JUSTIFICATION: TEAMMATE Tactical Proficiency Trainer (TM TPT) will allow the unit commander to conduct operator sustainment training as required while the operator personnel are in garrison on their own system. The TM TPT requirement is documented in Operational Requirements Document dated 7 Dec 92 and is required for systems fielded to active and reserve units. TM TPT will greatly enhance operator proficiency training and is an absolute requirement for TEAMMATE systems fielded to the Regional Training Sites Intelligence - SIGINT (RTSI-S) established for the in garrison training of reserve forces. Concept design includes two Versa Module Euro card (VME) circuit cards with cabling and two Computer Software Configuration Items (CSCI). Operationally, the concept design works by injecting a modulated RF signal into the TEAMMATE's Radio Frequency (RF) Distribution Unit from which simulations are made for the TEAMMATE system with a realistic environment simulator that will simulate communication intercept, AN/TRQ-32A(V)2 Direction Finding (DF), DF net, and Command, Control and Reporting capabilities as part of the TM systems function. TM TPT will reduce admin TDY costs assosciated with training. MODELS OF SYSTEMS AFFECTED: TRACKWOLF, AN/TSQ-152, SSN: V18200; Enhanced TRACKWOLF, AN/TSQ-199, SSN: V18200

DESCRIPTION / JUSTIFICATION:

TRACKWOLF(TW)/ENHANCED TRACKWOLF (ETW) are High Frequency (HF) Skywave Communications Intelligence systems which support Echelons Above Corps commanders by supplying intelligence and targeting information to theater level All Source Analysis Syste Materiel Changes (MC) will provide National and Army intelligence communities with a collection asset better equipped to meet the requirements of a rapidly changing and highly diverse HF environment. There are a number of enhancements which have been identified to keep the unit abreast of modern technological advances and changing threat. ETW is a congressionally directed program to resolve transportability shortfalls of the original TW system noted after operation DESERT STORM. ETW is housed entirely within transit cases for rapid deployment, ease of set up and tear down, and to allow maximum flexibility of power source selection. Software mods will allow for the automatic detection of the most modern modulations. MC's will provide analytical operators more extensive data base management functionality and improved in-garrision and field reporting capabili

DEVELOPMENT STATUS / MAJOR DEVELOPMENT MILESTONES:

- 1. Add ECP 40, SATCOM capability DF Flashnet to TRACKWOLF INSTALLATION COMPLETE OCT95
- 2.3.4. Add ECP 43 Improved audio recorder, add ECP 41 Squelch control, add ECP 44 Crosshair to TRACKWOLF INSTALLATION COMPLETE Dec 95.
- 5.6 Add ECP 1 to Enhanced TRACKWOLF (ETW), Communication Satellite Intercept Capability, and add ECP 2 additional workstation positions to ETW INSTALLATION COMPLETE PLANNED FOR FEB98. Note ETW SATCOM Intercept mod will require minor installation (plug in antenna) that the unit can perform and will not require installation costs in FY98.

INDIVIDUAL MODIFICATION Date February 1998

MODIFICATION TITLE: AN/PRD-13 (V) 2 Procurement 1-97-07-0001

MODELS OF SYSTEMS AFFECTED: AN/PRD-12 Interim Fix

DESCRIPTION / JUSTIFICATION:

The AN/PRD-12 is a man-transportable radio direction finding (DF) system fielded to Army units that performs intercept and line of bearing measurements and provides fix calculations when operating in the netted mode. The Army units rarely use the netting capability of the AN/PRD-12 and it is operationally difficult to establish and bare little influence on mission success. A requirement exists for an organic systo provide threat warning and situational awareness information directly to the supported unit. The system must be modular, very light we with minimal power requirements and configurable to support man-pack operation

JUSTIFICATION: The AN/PRD-13(V)2 procurement is an interim fix for the AN/PRD-12. Headquarters Department of the Army has directed the AN/PRD-13 be fielded by Special Operations Command (SOCOM) to US Army Light Divisions. The sustainment will be provided by Contractor Logistics Support with the primary vendor. All fielding and training will be accomplished by SOCOM.

DEVELOPMENT STATUS / MAJOR DEVELOPMENT MILESTONES:

DESCRIPTION:

Global Broadcast Service (GBS) is a joint service program that responds to the need for a continuous, high-speed, one-way broadcast of high volume multi-media information such as imagery, maps, weather data, logistics, air tasking orders, etc., to users worldwide. GBS is an integral part of the Defense Information Infrastructure (DII) and a part of the overall DoD Milsatcom architecture. The DoD GBS initiative was formalized by a Joint Acquisition Decision Memorandum, 27 Mar 96. The Army will be the GBS Joint Project Office's (JPO) Product Lead for the Fixed Receive Suites (FRS) and Transportable Receive Suites (TRS) acquistion for all users.

The GBS Receive Suites consist of a small satellite tracking and receiving antenna which receives and demodulates the RF downlink signal into a bit stream for receive broadcast management computer to decrypt and distribute to end users. An in-theater injection capability via Theater Injection Points (TIPs) will be designed to broadcast vital Commander in Chief (CINC)/ Commander Joint Task Force (CJTF) in-theater information to in-theater receive suites.

The Phase II GBS Program will take maximum advantage of existing technology and satellite capability. A competitive, best value contract was awarded Nov 97 which will leverage commercial items.

JUSTIFICATION:

FY 99 funds will procure 32 Transportable Receive Suites. The need for the GBS communication system was validated by the Joint Requirements Oversight Committee (JROC) in a Joint Mission Need Statement, dtd 3 Aug 95, and Joint Operational Requirements Document, dated 7 Apr 97. The GBS Phase II concept was validated by use of a GBS Phase I demonstration system in support of the Bosnia peace mission and Joint Warfighting Interoperability Demonstration (JWID) 95.

DESCRIPTION: This program will provide a tactical satellite communications capability to meet critical Ground Mobile Forces (GMF) Command, Control and Communication (C3) needs not satisfied by conventional terrestrial communications systems. The (GMF) are those components of the Army, Navy, Air Force, Marine Corps, Special Operations Forces and Joint Communications Support Element engaged in land, tactical air combat and amphibious operations ranging from single-service crisis missions to mutually supportive joint-service combat scenarios. Mod Of In-Svc Equipment (TACSAT) funds the upgrades to Army tactical satellite communications equipment.

JUSTIFICATION: The FY 99 funds will be used to manage and field prior year procurements of Lightweight High Gain X-Band Antennas (LHGXA). This program will allow the warfighter access to the Defense Satellite Communications System in support of reach-back communications requirements for power projection. This is in line with the continued upgrades of Army tactical satellite communications equipment.

DESCRIPTION: STAMIS Tactical Computers (STACOMP) are a group of Commercial Off-the-Shelf (COTS) computer systems supporting STAMIS tactical computer requirements for the US Army. These systems, used by soldiers on the battlefield to support Combat Service Support (CSS) missions at all levels, are transportable and user friendly. STACOMP COTS supports the following STAMIS: Standard Army Retail Supply System (SARSS), Standard Army Ammunition System (SAAS), Standard Army Maintenance System (SAMS), Department Army Movements Management System Redesign (DAMMS-R), Unit Level Logistics System (ULLS), Global Combat Support System-Army (GCSS-Army) formerly called Integrated Combat Service Support System (ICS3) and Standard Installation Division Personnel System-3 (SIDPERS-3).

GCSS-Army Phase I encompasses the logistics STAMIS (SARSS, SAAS, SAMS and ULLS). In March 1997, The Major Automated Information Systems Review Committee (MAISRC) granted Milestone 0/I/II approval to GCSS-Army, formerly called Integrated Combat Service Support System (ICS3), Phase 1 and Milestone 0 approval to GCSS-Army Phases 2 and 3. GCSS-Army will be the business/tactical automation enabler for the Army CSS mission area and will constitute the Army portion of the Global Combat Support System. Development and fielding of GCSS-Army will follow an incremental acquisition strategy combining development with incremental fielding of capability packages. GCSS-Army will be fielded in three phases. Phase 1 will include functionality of existing logistics STAMIS and is scheduled for Milestone III approval in 4QFY99 and will complete fielding FY03. Phase 2 will integrate the logistics wholesale and retail levels of CSS while Phase 3 will include joint functions. Phase 2 will conclude in FY04 and Phase 3 in FY06. Beginning in FY98, all STACOMP COTS hardware purchased for logistics STAMIS will support GCSS-Army functionalities.

JUSTIFICATION: FY99 funds procure COTS microcomputers for SAMS, ULLS, GCSS-Army, SIDPERS and STAMIS support systems.

DESCRIPTION: The All Source Analysis System (ASAS) Counter Intelligence/Human Intelligence (CI/HUMINT) subsystem is the CI/HUMINT component of the Intelligence and Electronic Warfare (IEW) sub-element of the Army Battle Command System (ABCS). It is a counter intelligence and human intelligence automation system that meets Army tactical CI/HUMINT information collection, investigation, interrogation, operation, document exploitation, and force protection automation requirements. The architecture is built from three sub-elements. The first tier tactical component is the CI/HUMINT Automated Tool Set (CHATS). CHATS operates at the Counter Intelligence Team/Interrogation Prisoner of War (IPW) Team level. The other two major components to the C1/HUMINT Management System architecture are the Counter Intelligence Operations/Interrogation Facility Workstation (OPS/IF WS) for DS/GS MI unit command and control which provides functional interfaces to the All Source Analysis System, and the CI Single-Source Processors (CI SSP) which will operate within the ASAS Analysis and Control Element (ACE). The standard workstation hardware configuration for the CI SSP and the OPS/IF WS will consist of baseline Common Hardware and Software (CHS) components.

JUSTIFICATION: FY99 funding supports the fielding of the remaining CHATS systems to the tactical force, Interim Contractor Support, and Program Management Administrative Support. Procurement prior to FY99 was through supplemental appropriation. The CHATS system provides agents the capability to manage assets and analyze information collected through investigations, interrogations, collection, and document exploitation. With CHATS, CI units may electronically store collected information in a local database, associate information with digital photography, and transmit/receive information over existing military and civilian communications. The CHATS provides these functions primarily with COTS software operating in a laptop computer within a hardened transport case.

DESCRIPTION: The Reserve Component Automation System (RCAS) is an automated information system that will provide the Army the capability to more effectively administer, manage and deploy Army National Guard and Army Reserve forces. The RCAS will link over 10,000 Guard and Reserve units at over 4,000 locations. The RCAS will support daily operational, training, and administrative tasks at all Guard and Reserve echelons, and will provide timely and accurate information to plan and support mobilization. The RCAS is an Acquisition Category 1AM program managed by the Chief, National Guard Bureau. The restructured RCAS contract was signed in January 1996. The redesigned system consists of commercial-off-the-shelf (COTS) hardware and office automation software, government off-the-shelf (GOTS) software, and new software applications integrated into an open system, PC-based architecture.

JUSTIFICATION: The RCAS Mission Needs Statement (MNS) was approved on 5 March 1996. Program goals and functional requirements are described in the approved April 1996 RCAS Operational Concept Description (OCD). The RCAS program approach was approved by the RCAS General Officer Steering Committee (GOSC), the OSD MAISRC, and Congress. On 23 September 1996 a joint OSD and Army MAISRC Overarching Integrated Process Team (OIPT) chaired by OSD (C31 Acquisition) unanimously approved the fielding of the first increment of the RCAS hardware and software. Increment One will provide the Reserve Component with personal computers, network servers, office automation, and a nation-wide infrastructure that will support electronic mail and file transfer. On 24 November 1997 an Integrating Integrated Process Team (IIPT) approved full fielding of Increment 2 of the RCAS. This increment adds database servers to the infrastructure and logistics functionality associated with GOTS software to include Unit Level Logistics System (ULLS)-Ground, ULLS-S4, and Standard Property Book System-Redesign (SPBS-R). The annual requirements specified above support the development and fielding of the system in accordance with the approved schedule. FY98 is scheduled to field the system to 7 USAR commands and 9 ARNG states, principally in the midwest. FY99 is scheduled to field the system to 8 USAR commands and 9 ARNG states in the West and Southeast U.S.

REMARKS:

The RCAS is a "turn key" system, and as such, is considered one system. The quantity therefore is one.

Source Selection for the Development and Deployment Phase was completed during the fourth quarter, FY 1991.

Unit costs only reflect hardware and software acquisition costs. Other essential contract costs associated with the development and fielding of the system are not included in the unit costs.

Contract award dates are for annual renewals of the base contract awarded in 1991.

DESCRIPTION: This program includes the procurement of five command post variants, each designed to accommodate the various Battlefield Functional Areas of the Army Battle Command System (ABCS). These include the Army Tactical Command and Control System (ATCCS), the Advanced Field Artillery Tactical Data System (AFATDS), the Command Service Support Control System (CSSCS), the Forward Area Air Defense Command and Control System (FAADC2), the Extended Air Defense Command and Control System (EAD), and the Integrated Meterological System (IMETS). The five command post variants are:

- (1) A Tent Command Post (CP) that consists of a lightweight aluminum frame, interchangeable fabric wall sections, fabric roof, floors and liners, work tables, mapboards, and light set. The Tent CP can be complexed to other tents and to other SICPS variants via an interface wall.
- (2) A Rigid Wall Shelter (RWS) CP mounted on the Heavy High Mobility Multipurpose Vehicle (HHMMWV) Shelter Carrier consisting of an on-board generator, power conversion/distribution system, environmental control unit, collective chemical protection, signal and power pass-through panels, antenna mounts, equipment mounts, equipment racks to accommodate two ABCS workstations, operator seats, a vehicle intercom system and a 10 meter Quick Erect Antenna Mast (QEAM).
- (3) Conversion Kits for the M577 Track Vehicle consisting of equipment racks for two ABCS workstations, power and signal panels, tent interface panel, operator seats, antenna mounts, stowaage provisions, an updated Auxillary Power Unit (APU), a vehicular intercom system, a power distribution system, a 10 meter QEAM, and a signal/data wiring module. The converted M577 has been designated the M1068 Track CP.

Wpn Sys Proc U/C		_										

DESCRIPTION: This budget line supports visual information (VI) processes for all MACOMs and HQDA Field Operating Agencies (FOAs). Department of Defense (DOD)/Army authorized VI activities provide audio-visually-based products and services to support Armywide training and readiness, force development, mobilization, health, safety, documentation of diagnostics for medical, historical, and professional information. VI support includes imagery for installation power projection platforms, video productions (especially for Military Occupation Skill (MOS) training and readiness, safety and intelligence), electronic imaging, and photography (including DA official photos). VI equipment acquired with this budget line provides commanders with video, photography, electronic imaging, audio, and other computer generated media which can be integrated to convey real time, two-way information throughout the chain of command.

All equipment has been approved for purchase through the Requirements process and included in the Visual Information Systems Program (VISP). The VISP Program is the only means for commanders to procure, replace or augment their VI investment systems and equipment. The equipment in the VISP has been reviewed and prioritized, both by MACOMs, and Headquarters, Department of Army, Director, Information Systems for Command, Control, Communications and Computers (DISC4). These funds are in support of the Army Plan SEC VII, Para J3b(4), "Obtain a family of information systems to meet the needs of all disciplines ... developed in the context of approved information models and architecture." Funds will purchase equipment to support the transition to electronic imaging (away from hazardous chemical processes) and replace equipment past its life cycle for commanders at each post, camp and station, plus HQDA, Office of the Joint Chiefs of Staff, Office of the Secretary of Defense, the Pentagon, other government agencies in the National Capital Region, as well as the U.S. Military Academy, National Defense University CAPSTONE course, Training and Doctrine Command (TRADOC) schools, and the National Guard and Army Reserves training.

JUSTIFICATION: FY 99 funds provide VI equipment for Army elements to directly support the warfighter. The equipment to be purchased is listed in the associated FY VISP acquisition sequence. Funds will acquire replacement VI investment equipment/systems to produce training materials and other VI products to support the warfighter. Existing equipment is obsolete, requiring excessive maintenance dollars and long unnecessary "throughput" times.

DECODIDATION			•	•	•	•	•	•	•	•	•	

DESCRIPTION:

This budget line supports automation requirements for the Army Intelligence and Electronic Warfare Master Plan (AIMP). The AIMP uses capabilities from the Force Integration Masterplanner (FIM) to develop decision support aids that facilitate development and display of intelligence force structure, architectures and systems. The FIM is a computer-based system of systems using commercial-off-the-shelf (COTS) software to support PPBES decision making in the Intelligence and Electronic Warfare (IEW) community. The AIMP is a publication mechanism that presents the IEW future vision to Army consumers over Intelink and Intelink-S.

JUSTIFICATION:

FY99 funds will be used to continue replacing proprietary and obsolete hardware with standard COTS UNIX platforms and software. This provides the potential for interoperability with other UNIX applications, reduces hardware maintenance costs, and provides significantly better processing capability. FY99 funds will also be used to acquire high speed product servers for Intelink & Intelink-S networks making the FIM products available to any Army consumer, world-wide. Hardware and software procured will support Headquarters, Department of the Army, and FIM field support sites at Fort Belvoir, Fort Huachuca, and Fort Monmouth.

DESCRIPTION: This line supports intelligence related (TIARA and non-TIARA) programs and activities for training Cryptologic, Signals Intelligence (SIGINT), Electr Warfare (EW), and Imagery Intelligence (IMINT) skills. Funds will: upgrade devices to maintain commonality across similar systems; continue development and exploration of transferability of skill among UNIX-based program workstations; enable a seamless learning environment which facilitates time-shifted learning, self-pastudy, and participation in realistic synthetic environments. New procedures and environments for training will enable students to work on real-world products and operations in support of the field Army. Students in one class will be able to team with students in another class or course in a common networked environment. All training devices should be built to a common simulation data architecture so they can use common data feeds and participate in virtual exercises. Simulations can a so be delivered in target languages.

JUSTIFICATION: FY98 supports the following requirements: completes transition of MI Simulation Center to full DIS compliance; completes transition of SCI training LAN capabilities to full integration with JWICS Intellink; initiates acquisition of CI/HUMINT Automated Training System (CHATS); integrates all officer unclassified training material into a common software environment with standardized hardware; provides every instructor with a common software environment and plug-in networks available in classified and unclassified classrooms to present instruction and to handle training administration; obtains standardized low end multimedia presentation tools for both AC and RC; develops a high-speed path for all students and instructors to an industry on-line services provider; SUN Microsystems support of SIGINT Analyst training for programs such as ASAS and TROJAN; and imagery analyst training capabilities which mirror national imagery systems for TENCAP.
